Technical Memorandum

Memorandum

April 21, 2017

To:	Town of Halifax, MA	Ref. No.:	11110997
From:	Russ Kleekamp, GHD Jeff Bellino, PE, GHD Craig Curtin, GHD	Tel:	774-470-1631
CC:			

Subject: **DRAFT - Halifax Stormwater Outfall Assessment – Technical Memorandum**

1. Purpose of Memorandum

The Town of Halifax, MA retained GHD Inc. to assess the stormwater outfalls discharging to the Monponsett Ponds as part of the New England Interstate Water Pollution Control Commission Grant. GHD Identified 21 discharges in the area of East Monponsett Pond and 19 discharges in the area of West Monponsett Pond. Of the 21 outfalls in the area of East Monponsett Pond, 15 are discharging directly into the East Monponsett Pond or to an area that is abutting the pond. Of the 19 outfalls in the area of the West Monponsett Pond, 10 are discharging directly to the West Monponsett Pond or to an area that is abutting the pond. As part of the Agreement, The Town of Halifax developed eleven tasks to be completed during the project. This memorandum will outline how each of the eleven tasks were completed.

2. Task 1: Quality Assurance Project Plan (QAPP)

A Quality Assurance Project Plan (QAPP) was developed in accordance with the New England Interstate Water Pollution Control Commission (NEIWPCC) and Environmental Protection Agency (EPA) standards. The QAPP summarized the scope of the project and set guidelines for how data would be collected during the project. This technical memorandum provided details on how each of the tasks developed in the QAPP were conducted. The QAPP for this project are included in Attachment A (QAPP).

3. Task 2: Project Kick-Off Meeting

The Kick-Off meeting for this project was held on September 21, 2016 at the Halifax Highway Department at 8:30 am. The meeting included Russ Kleekamp and Craig Curtin from GHD, Cathy Drinan from the Board of Health, Robert Badore from the Highway Department, and Kim Roy from the Board of Selectmen. This meeting was held to review the scope of the project, discuss the existing stormwater mapping, and allocate responsibilities for the project. Mr. Kleekamp discussed how GHD proposed to complete each of the tasks

and accepted advice from the Town on how best to complete each of the tasks. The meeting minutes for this meeting are included in Attachment B (Kick-Off Meeting Minutes).

4. Task 3: Field Verification of Outfalls and Point Sources

The field verification task included locating the catch basins, stormwater outfalls, swales, or any other sources of stormwater influences within the contributing area surrounding the ponds. The Old Colony Planning Council previously developed a Halifax Stormwater Study, which included mapping of the stormwater system. This mapping was used as a starting point for the field verification process. The existing mapping was found to contain data gaps such as disconnected pipes and unconfirmed attributes. Craig Curtin and members of the Highway Department spent several days in the contributing area of the ponds, verifying what was found in the Old Colony Planning Council's Stormwater Study and making notes of anything not originally on the maps.

While in the field, each of the catch basins in the contributing areas were opened and examined. During this process, a picture was taken of the interior and exterior of the catch basin, when applicable. A catch basin inspection form was completed for each of the catch basins. The form documented the location, condition, and pipe layout for each of the catch basins. There were approximately 236 catch basins identified and documented within the drainage system contributing to the East and West Monponsett Ponds.

A similar process was also completed for the verification of the outfalls within the contributing area of the ponds. While the catch basin inspections were conducted, the drainage system outfalls that could be found were located. To distinguish which pond the outfalls discharged into, they were assigned a unique Outfall ID. For the outfalls discharging into the West Monponsett Pond, the Outfall ID was OW-XX and for the East Monponsett Pond the Outfall ID was OE-XX. Craig Curtin later revisited the outfalls to conduct a dry-weather inspection. Attachment C (Outfalls in Project Area) includes the information gathered on each of the outfalls in the project areas. Outfall OE-13 is considered a culvert that discharges to the East Monponsett Pond, however, since this is not a drainage system outfall, there is no drainage area recorded in Attachment C (Outfalls in Project Area). OE-13 is included in this study as it is a large culvert discharging to the East Monponsett Pond.

A dry-weather inspection is conducted only when no more than 0.1 inches of rainfall has occurred in the previous 24-hour period and no significant snowmelt is occurring. During this "dry-weather period" there should be no flow leaving the outfall pipe unless there is an illicit discharge entering the drainage system or there is a base flow from ground or surface water causing a discharge. During this inspection, Dry Weather Outfall Inspection Forms were completed and pictures of the outfalls were taken. The inspection form includes the size, location, and observation of flow for each of the outfalls. The Dry-Weather Outfall Inspection Forms are included in Attachment D (Dry-Weather Outfall Inspection Forms).

At OW-04, flow was found during the dry-weather inspection and was investigated. The flow was found to be coming from CB-111 that had a water line bleeder from the municipal water system discharging into the catch basin. This was documented on the catch basin inspection form for CB-111 and on the outfall inspection form for OW-04. This was considered an acceptable discharge as the water line contains potable water.

5. Task 4: Point Source (Outfall) Mapping

Once the stormwater structures were identified in the field, a Geographic Information Systems (GIS) map was developed to show the locations of the verified catch basins, stormwater piping, and outfalls within the contributing areas of the ponds. The mapping was developed by using the locations of the structures provided from the Old Colony Planning Council's Halifax Stormwater Study. Any new catch basins found during the field verification were added using locations that could be found in Google Earth. The pipes that were found to be different in the field than the original map were changed and added to the GIS map.

The map created in GIS was delivered as an 11 in. x 17 in. Map Book that included block maps outlining different components of the stormwater system.

6. Task 5: Delineation of Drainage Areas and Stormwater Calculations

The delineation of the drainage areas was completed in order to find the extent of the drainage areas for each of the outfalls found within the ponds' contribution areas. The drainage areas were delineated by creating a file in AutoCAD from the map produced in GIS and then using contours produced by LIDAR to find the high and low elevations. By using the elevations and the drainage systems, the watersheds were delineated to show the total area contributing to each of the outfalls.

An impervious surface layer from MassGIS was brought into the AutoCAD file to find the total impervious area within each of the drainage areas. The total impervious area in each drainage area is important to know because the impervious area can generate the majority of the runoff entering the drainage systems. The amount of impervious area was used as one of the factors in the prioritization matrix.

The drainage areas were used to calculate the storage volumes for the 0.50-inch, 1.00-inch, and 1.25-inch rain events. These storage volumes were used in the design of the size of the stormwater systems.

The peak runoff from the 2-year, 5-year, 10-year, and 25-year storm events were calculated for each of the drainage areas, using the STEEL Equation. The project area is located in U.S. Region 3 and the drainage areas were assumed to have a time of concentration of 5 minutes and a runoff coefficient of 0.95 (asphalt pavement). The intensities for each of the storm events were calculated using the equation $i = a/(d+b)$, (i = intensity, a and b are constants, and d = the time of concentration in minutes). Attachment E (Peak Runoff Calculations for 2-Year, 5-Year, 10-Year, and 25-Year Storm Events) includes a summary of the equations, constants, and assumptions used in calculating the peak runoff of the 2-year, 5-year, 10-year, and 25-year storm events. Once the intensities for each of the storm events were calculated, the peak runoff could be calculated for each of the drainage areas. The equation used to calculate the peak runoff flow was $Q=CiA$ (Q = Flow, C = Runoff Coefficient, i = intensity, and A = Area in acres). Attachment E (Peak Runoff Calculations for 2-Year, 5-Year, 10-Year, and 25-Year Storm Events) includes the peak runoff flows for each of the drainage areas and a summary of the constants and assumptions used in the equations.

7. Task 6: Prioritization Matrix

Following the delineation of the drainage areas, a prioritization matrix was developed to prioritize the drainage areas around the ponds. Each of the criteria for prioritizing the outfalls is explained below.

7.1 Location of Outfall Discharge

Since the West Monponsett Pond has the lowest quality of water out of the two ponds, GHD and the Town of Halifax agreed that the outfalls on West Monponsett Pond would be of higher priority than those on East Monponsett Pond. In the prioritization matrix, the outfalls that were not discharging directly into the West Monponsett Pond or in an area abutting the West Monponsett Pond were removed. Therefore, only the thirteen outfalls discharging to the West Monponsett Pond or to an area abutting the West Monponsett Pond were prioritized. Outfalls OW-02 and OW-03 are located in close proximity to each other and therefore, the outfalls were determined to have the same drainage area. Since the drainage area was the same, the outfalls were provided with the same scores during the prioritization of the outfalls. Treatment of the stormwater entering the outfalls on West Monponsett Pond would be designed to help improve the water quality of the West Monponsett Pond.

7.2 Total Impervious Surface Area

Another important parameter was the amount of impervious surface within the drainage area. Impervious surface generates the majority of stormwater runoff, as the surface does not allow the water to recharge into the ground. While traveling along the impervious surface, the runoff collects organic matter, inorganics, trash, debris, and other material that would not naturally make its way into the ponds. When enough of these materials enter the ponds, they can affect the water quality in the ponds. Implementing a stormwater management system in a drainage area with a high impervious area can reduce the amount of untreated runoff from discharging directly into the ponds.

7.3 Total Surface Area

Along with the impervious area, the total surface area was also used as a criterion for prioritizing the outfalls. Including the total area in the prioritization is important because pervious area can also contribute nutrients to the stormwater runoff. The undeveloped pervious areas in Halifax include the woodlands and wetlands, which can naturally filter the stormwater runoff. However, the developed pervious surface areas, which include cranberry bogs and residential yards, can also contain excess nutrients. The nutrients can be found in fertilizers and yard waste. When runoff is generated on these pervious areas, the nutrients from the fertilizers and pet waste can end up flowing into the drainage system.

7.4 Cost of Implementation

The cost of implementation is another important parameter in determining the priority outfalls as the cost can determine if a design will be implemented. The cost of implementation was estimated by working with stormwater system manufacturers to receive cost estimates for the individual systems designed as part of the conceptual design task. The costs developed in the conceptual and preliminary design plans were used in the prioritization matrix.

7.5 Required Operation and Maintenance of the Recommended System

Implementation of any design would increase the maintenance required to keep the stormwater systems operating as designed. The different stormwater systems can require maintenance from removing debris in the catch basin inserts to using heavy machinery to clear out large amounts of sediment and debris. Each system will require different maintenance as some contribution areas will have more debris and sediment than others. If the stormwater systems are not maintained as recommended, they will likely not provide the designed amount of treatment.

7.6 Past Sampling Results Indicating Frequent Spikes of Coliform and/or Algal Blooms

A few outfalls have been sampled for spikes in coliform and algal blooms. Since each outfall has not been sampled, this criterion was not considered in the scoring part of the prioritization. However, two of the three outfall locations found to be of highest priority were outfalls that were found to have spikes in coliform and/or algal blooms. Stormwater systems installed at these outfalls could therefore be designed to remove the nutrients from entering the ponds.

7.7 Results from Prioritization of Outfalls

The prioritization of the outfalls was conducted by sorting the thirteen outfalls for each criterion and providing scores of 1 to 12 for the outfalls, since OW-02 and OW-03 were considered the same for this exercise (see Section 7.1). The scoring was based on providing the highest priority outfalls for each criterion with the smallest scoring value. For example, the outfall's drainage area with the largest impervious surface area (highest priority) was assigned a score of 1 and the outfall's drainage area with the smallest impervious surface area (lowest priority) was assigned a score of 12.

For the total impervious surface area criterion, the outfall with the largest impervious area was of highest priority and assigned a score of one. For the total surface area criterion, the outfall with the largest total surface area was of highest priority and was assigned a score of one. For the cost per design plans criterion, the outfalls with the lowest cost estimate was of highest priority and was assigned a score of one. Once the outfalls had a score for each category, the scores were summed and the outfalls with the smallest overall scores were considered the top priority outfalls. The scoring for the prioritization matrix is included in Attachment F (Outfall Prioritization Matrix).

Using the criteria outlined above, the outfalls were prioritized and the outfalls of top priority can be found in Table 1. Sampling at outfall locations has been conducted routinely by the Halifax Board of Health at the Halifax Beach on Richview Avenue and the Ocean Avenue Beach in the Town of Hanson. Sampling at the location of OW-16 has not been conducted, so Table 1 reports the sampling results as N/A (Not Applicable).

Table 1 High Priority Outfalls

Outfall	Location	Discharge on Town Land?	Total Impervious Area (Square Feet)	Total Area (Square Feet)	Sampling Results with Coliform and/or Algal Blooms
OW-19	Ocean Ave on Hanson/Halifax Border	No	504,000	70,000	Yes
OW-16	Monponsett Street	Yes	113,800	149,100	N/A
OW-09	Richview Avenue	Yes	46,000	341,600	Yes

OW-19 located in Hanson, Massachusetts on Ocean Avenue was chosen as one of the prioritized outfalls because it scored highest during the prioritization exercise. This location scored highest on the total drainage area and second on the total impervious surface area. The existing outfall is located in the parcel adjacent to the Ocean Ave Beach, which has previously reported sampling results with coliform and/or algal blooms. The outfall is located on private property, and the upstream catch basin is located in the driveway of 1 Ocean Avenue in the Town of Hanson. A subsurface infiltration system could be installed in Ocean Avenue with the overflow runoff discharging through the existing outfall. Since the location of the system would be on the town border of Halifax and Hanson, the two Towns would need to agree on the location of the stormwater system.

OW-16 located on Monponsett Street was also chosen as one of the three outfalls to be prioritized and designed to the preliminary level (see Section 9). This location is currently an outfall for the drainage system along Monponsett Street and acts as a culvert connecting the large wetland to the east of Monponsett Street, which borders the East Monponsett Pond to the north. Combining the natural flow from a culvert with a drainage system is not recommended and was another reason to prioritize this outfall. The abutter to the outfall stated that the outfall produces a large amount of sediment and must be shoveled from the discharge point occasionally. This outfall is also located on two town-owned parcels, which would allow the Town to implement a system in this location without an easement.

OW-09, located adjacent to the Halifax Beach Association on Richview Avenue, was another outfall that was chosen as one of the prioritized outfalls. The Halifax Beach Association has been closed due to the water quality of West Monponsett Pond since June of 2015. This location has had algal blooms following large storm events. The area of the beach could be used to implement a subsurface treatment system, which would be installed beneath the sand and still used as a beach following construction. Since a large surface area contributes to this outfall, a stormwater system would be able to reduce the amount of nutrients entering the West Monponsett Pond.

8. Task 7: Conceptual Designs

Conceptual designs were developed for each of the outfalls within the contributing area of the Monponsett Ponds. Even though some stormwater systems were field verified and provided in the point source mapping (Task 4), only the drainage systems that discharged either directly to one of the ponds or in the direction of the ponds were provided a conceptual design. The Town of Halifax has a Draft Total Maximum Daily Load

(TMDL) report for the West and East Monponsett Ponds. This TMDL states that the current phosphorus loading, produced by stormwater runoff, will need to be reduced by 50%. The conceptual plans were designed using stormwater management systems that may be capable of removing more than 50% of the Total Phosphorus. In outfall locations where there is little separation between the existing grade and the groundwater table, the conceptual designs may not be able to remove 50% of the phosphorus. To offset the low phosphorus reduction rates at these outfalls, the other outfalls were designed to remove more than 50% of phosphorus.

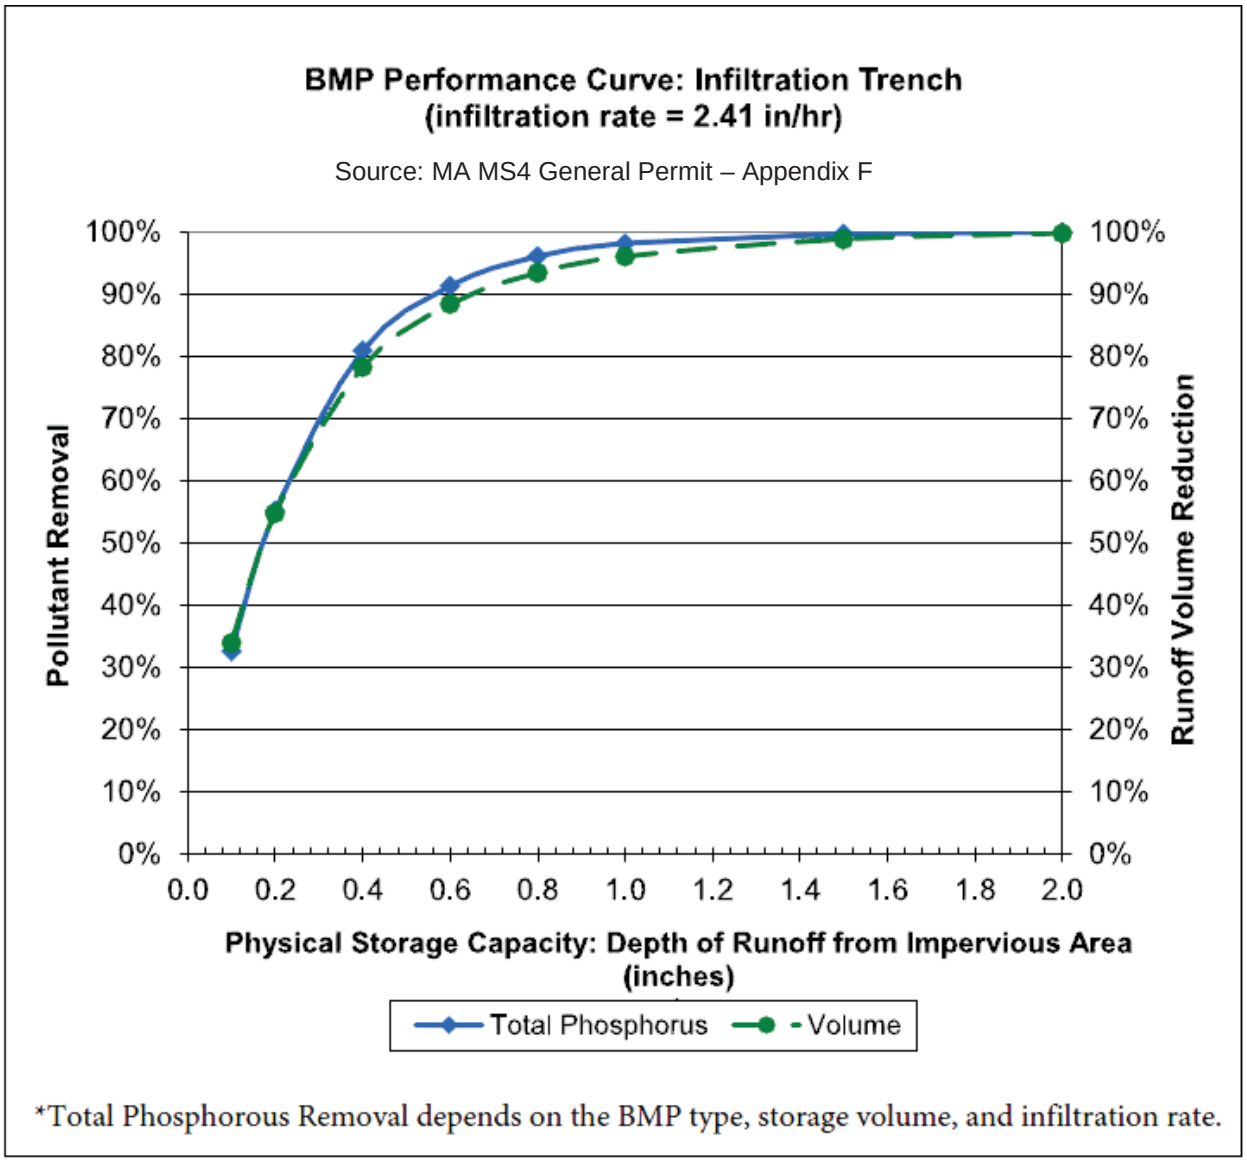

The conceptual designs were developed to provide the Town of Halifax with different options for implementation. The conceptual designs are intended to meet the MS4 permitting to the maximum extent practicable and are based on minimizing the total cost of implementation. These designs can be enhanced if the Town requests more treatment of the stormwater runoff.

Subsurface leaching was designed in locations where there was sufficient separation to the water table. In areas that did not have enough separation from the water table, or where there was only a small amount of impervious area flowing to the system, catch basin inserts were recommended. The catch basin inserts are able to be placed in existing catch basins and can be custom made for unusual or damaged structures. The proposed catch basin inserts are capable of removing up to 80% Total Phosphorus from a maximum inflow of 0.25 cubic feet per second (CFS). To further quantify the phosphorus removal rates, drainage calculations, loading rates, and phosphorus export rates would need to be performed. The proposed subsurface infiltration systems are capable of removing over 50% of the phosphorus load to the Best Management Practice (BMP). Systems designed to store and infiltrate ½-inch of runoff (from impervious surfaces) can achieve approximately 80% Total Phosphorus removal rates. Removal rates depend on the BMP type, storage volume, and infiltration rate; in general, most of the systems designed can achieve 80% removal rates.

For the conceptual designs, Cultec 330XLHD and Cultec 902HD chambers were used to size the infiltration areas for each drainage area utilizing subsurface leaching. The individual Cultec 330XLHD chambers have a minimum storage area of approximately 86 cubic feet per unit installed and have an installed length of 7 feet and an installed width of 52 inches. The individual Cultec 902HD chambers have a minimum installed storage of approximately 100 cubic feet per unit installed and have an installed length of 3.67 feet and an installed width of 78 inches. The storage volumes and unit sizes of the Cultec units are based on Cultec's "Stormwater Management Design Guide". In most cases, the runoff flows from the catch basins into a drain manhole before entering the infiltration system. In large drainage areas, the runoff flows from the catch basins to a drain manhole and then to a settling tank, before entering the infiltration system. The proposed drainage pipe was designed to be 12-inch high-density polyethylene (HDPE) Pipe throughout the project area.

The Massachusetts MS4 General Permit for Stormwater Discharges of 2016 (General Permit) includes a figure (Figure 1) that reports the estimated phosphorus removal when using an infiltration trench to capture and treat stormwater runoff. The General Permit defines infiltration trenches as systems that "provide temporary storage of runoff using the void spaces within the soil/sand/gravel mixture that is used to backfill the trench for subsequent infiltration into the surrounding sub-soils". The Cultec systems are therefore considered infiltration trenches.

Figure 1 BMP Performance Curve: Infiltration Trench

Based on Figure 1, the infiltration trenches storing the ½-inch runoff volume are capable of removing approximately 85% of phosphorus loading.

8.1 Phosphorous Removal from Conceptual Designs

The stormwater systems in the conceptual designs were designed to remove at least 50% of the phosphorus loading. Based on the information provided in Figure 1, the conceptual designs are capable of removing 88% of the phosphorus. Figure 1 was used to estimate the pollutant removal when using an infiltration trench with an infiltration rate of 2.41 in/hr. After researching the septic information and conducting a Web Soil Survey, it

was found that the soil in Halifax has infiltration rates between 2.41 in/hr and 8.27 in/hr. A conservative infiltration rate of 2.47 in/hr was used to estimate the pollutant removal.

The pollutant removal is calculated by first finding the storage capacity of the stormwater systems. This storage capacity was used to estimate the depth of runoff the stormwater systems could store. The volume of runoff entering the stormwater system is estimated by finding the area of the impervious surface contributing to the stormwater systems and multiplying it by the depth of the runoff. Once the depth of runoff is estimated, it can be used to estimate the phosphorus removal by using Figure 1. Setting the depth of runoff as the x-axis, the pollutant removal can be found by using the blue "Total Phosphorus" line and the y-axis to estimate the phosphorus removal. The phosphorus removal for each of the conceptual designs was estimated and reported in the cost estimates. The phosphorus removal from the five conceptual designs, only designed with catch basin inserts, were not included as part of the total phosphorus removal. They were not included because Figure 1 estimates the phosphorus removal for only the infiltration trenches. The catch basin inserts are designed to remove up to 80% of phosphorus from a maximum inflow of 0.25 CFS. The average removal for the conceptual designs was calculated to be approximately 88% phosphorus removal. By removing approximately 88% of the phosphorus from the outfalls discharging to the ponds, the TMDL requirements could be fulfilled.

Since the stormwater systems are designed to store 50% of the 1-inch runoff volume, the systems can be described as capable of storing the "first flush" from storm events. The first flush is considered to include the majority of the nutrients because the first flush can capture the nutrients that are found on top of the impervious surfaces. By designing the systems to treat the first flush, in the case of a large storm event, the runoff overflowing back into the existing outfalls should contain smaller amounts of nutrients than it would without the stormwater systems.

8.2 Nonstructural Forms of Stormwater Management

Nonstructural forms of stormwater management can increase the reduction of phosphorus and other nutrients in the stormwater as well. One nonstructural form of stormwater management is to conduct routine street sweeping of the impervious areas within the drainage areas discharging into the ponds. If conducted routinely, the street sweeping can help to remove sediment from the impervious areas and therefore reduce the amount that enters the drainage system following rainfall events. A study conducted in Cambridge, MA by the New England Water Science Center from 2009 to 2011 found that monthly street sweeping could produce an 8.0% reduction in phosphorus. Based on the results found in the study, it is estimated that a 2.5% reduction in phosphorus could be achieved if the Town of Halifax conducted street sweeping twice per year.

Another form of nonstructural stormwater management is public outreach. The public can contribute nutrient loading during normal activities. The actions that can contribute large amounts of nutrients include over-fertilizing with fertilizers containing large amounts of nutrients and not disposing of pet wastes. When fertilizers are used in excess by residents, storm events can cause the fertilizer to runoff onto the street and enter the drainage systems. When pet wastes are not disposed of properly, the nutrients within the wastes can be brought into the drainage systems during a storm event. By holding workshops for the public or delivering educational pamphlets at schools, residents can learn how their actions are affecting the health of the ponds and how they can help reduce their nutrient contribution.

9. Task 8: Preliminary Design

The conceptual designs for the systems at the top three priority outfalls were developed to the preliminary (or permit) level of detail. This included a detailed topographic survey, wetland delineation, preliminary project specifications and invert and elevation information for each of the individual systems. The top priority locations in Halifax were surveyed to provide more detailed information of the sites. The contours, features, and structures were created in the drawing based on information from MassGIS.

The preliminary designs include deep-sump catch basins, new 12-inch HDPE drainage pipe, settling tanks, infiltration trenches, and infiltration basins. The settling tanks include three chambers, each sized to store the 1/10-inch runoff volume from the impervious area contributing to the stormwater system. The existing drainage system was utilized in the preliminary designs where appropriate and proposed piping was designed to connect the existing drainage system to the proposed drainage systems. The three preliminary designs include some form of overflow protection that allows the stormwater to overflow to the existing outfall in the case of a large storm event.

The preliminary design for OW-09, the Halifax Beach Association outfall, includes connecting the existing drainage system to an 8,000-gallon settling tank that flows into an infiltration field underneath the beach. The infiltration field consists of 21 Cultec 330XLHD units and will be designed to store approximately 43% of the 1-inch runoff volume. This system will be capable of removing approximately 1.15 pounds of phosphorus from entering the West Monponsett Pond.

The preliminary design for OW-16, the outfall connected to the culvert on Monponsett Street (Route 58), is designed to have two stormwater management systems. System #1 will connect to the existing drainage system to the North of the outfall location and System #2 will connect to the existing drainage system to the South of the outfall location. System #1 is designed to install a drainage pipe from the drain manhole in the street to a 6,000-gallon settling tank, before discharging into an infiltration field. The infiltration field for System #1 includes four 6 feet diameter by 4 feet deep leaching pits. System #2 will include a 10,000-gallon settling tank that connects to the existing drainage system, discharges to an infiltration area, and then overflows into a surface treatment system. System #1 and System #2 are designed to store approximately 48% and 35% of the 1-inch runoff volume, respectively. System #1 will be capable of removing approximately 0.78 pounds of phosphorus and System #2 will be capable of removing 1.85 pounds of phosphorus from entering the West Monponsett Pond.

The preliminary design for OW-19, the outfall located on Ocean Avenue in the Town of Hanson, includes the installation of a new deep sump catch basin and the installation of a stormwater management system. The existing drainage system will be connected to a 10,000-gallon settling tank before discharging into an infiltration field. The infiltration field consists of 24 Cultec 330XLHD units and will be located beneath Ocean Avenue, with parts of the infiltration field in the Town of Hanson and parts in the Town of Halifax. The stormwater management system for OW-19 is designed to store approximately 35% of the 1-inch runoff volume. This system will be capable of removing approximately 1.52 pounds of phosphorus from entering the West Monponsett Pond.

10. Task 9: Cost Estimates

The cost estimates were developed by working with manufacturers of similar stormwater systems to those designed for the outfalls in Halifax. These cost estimates can be used to determine the necessary funding and planning for the implementation of each outfall. The estimates are broken down by line item for each of the individual outfall locations. The costs estimated in this section are only based on the outfall locations brought to the conceptual and preliminary design level and therefore do not include the outfalls that are not discharging towards either of the ponds. The final cost estimates include a contingency factor of 20%, an engineering factor of 10%, a permit factor of 5%, a construction administration factor of 10%, and contractor overhead (10%) and profit (10%). These factors are applied to the construction costs based on the material costs. Table 2 summarizes the unit costs for the cost estimates of the conceptual designs.

Table 2 Unit Costs

Item	Units	Cost*
12-Inch HDPE Pipe	LF	$65
Asphalt (Removed and Replaced)	SY	$35
Cultec Infiltration	EA	$1,000
Leaching Pits	EA	$4,000
Surface Treatment	SY	$200
Catch Basin Insert**	EA	$965
Settling Tank	EA	$7,500
Drain Manhole	EA	$5,000
Deep-Sump Catch Basin	EA	$5,000
*The costs are based on the 2017 dollar **Based on the inserts fitting without modification needed		

When estimating the area of asphalt to be removed and replaced for installation of the stormwater structures and the trench for the proposed 12-inch HDPE drainage pipe, the following was assumed:

- For installation of 12-inch HDPE drainage pipe a 4-foot wide trench would be created and therefore the area of asphalt to be removed and replaced would be approximately the length of the pipe multiplied by the 4-foot wide trench.
- For installation of the deep-sump catch basins and drain manholes, the area of asphalt to be removed and replaced would be approximately 100 square feet.
- For installation of the 8 feet x 14 feet settling tank, the area of asphalt to be removed and replaced would be approximately 247 square feet. This area assumes the trench for the settling tank will be 13 feet x 19 feet.
- For installation of the Cultec units, the area of asphalt to be removed and replaced would be approximately 36 square feet.

The cost estimate provides three different options for implementation and the costs associated with each option. The first option is to install catch basin inserts in all of the catch basins within each drainage area.

The second option is to take all the catch basins and install deep-sump catch basins with the catch basin inserts as well. The third option provides the costs if the Town decided to create the stormwater management systems based on the conceptual designs. The cost estimate was created first using the unit costs from Table 2 to calculate the construction cost for each of the drainage areas. The construction costs for each drainage area were rounded to the nearest $5,000 for costs greater than $5,000 and, for costs less than $5,000, the cost was rounded to the nearest $1,000. Once the construction costs were estimated, a 20% contingency factor, a 10% engineering factor, a 5% permitting factor, and a 10% construction administration factor were added on top of the construction cost. The final cost estimates for each of the three options are summarized in Table 3. A breakdown of the costs estimates for each of the drainage areas can be found in Attachment G (Cost Estimates).

Table 3 Cost Estimate

Option	Construction Cost	Contingency (20%)	Engineering (10%)	Permit (5%)	Construction Administration (10%)	Total Project Cost
Catch Basin Insert Only	$104,000	$21,000	$10,000	$5,000	$10,000	$150,000
Catch Basin Insert and Deep-Sump Catch Basin	$1,000,000	$200,000	$100,000	$50,000	$100,000	$1,450,000
Conceptual Design Plans (Non Primary Outfalls)	$1,936,000	$387,000	$194,000	$97,000	$194,000	$2,810,000
Preliminary Design Plans (Primary Outfalls)	$220,000	$44,000	$22,000	$11,000	$22,000	$320,000

Following the installation of the stormwater management systems, the systems will need to be maintained in order for the systems to function as designed. Manufacturers of the catch basin inserts recommend cleaning the units twice per year by removing debris, sand, and silt. The catch basin insert cartridges are recommended to be replaced once per year. These maintenance recommendations will depend on the location of the catch basins because the catch basins in areas with large amounts of sediment and foliage will require a more aggressive maintenance schedule.

The Town requested an estimation of the increase in maintenance for future planning. For conservative purposes, the maintenance was assumed to be conducted four times per year, each inspection would take about 1 hour, and the maintenance would be conducted by a Highway Department employee at $25/ hour. Based on the catch basin insert only design, 103 catch basins would receive a catch basin insert. Table 4 summarizes the cost of maintenance based on the previously described assumptions.

Table 4 Maintenance Cost Estimate

Catch Basins	Inspections per Year	Duration of Inspection and Maintenance	Highway Department Hourly Rate	Maintenance Cost
103	4	1 hour	$25/hour	$10,300

Table 4 is based on costs for the maintenance of catch basin inserts only and does not include the maintenance of the Cultec systems or settling tanks. In addition to the $10,300 of maintenance cost, it is recommended that the catch basin inserts be replaced once per year. At a cost of $215, the total cost to replace all the catch basin filters will be approximately $22,145 per year. The yearly maintenance cost for the catch basin inserts will be approximately $10,300 per year.

Table 5 Cartridge Replacement Cost Estimate

Catch Basins	Cost to Replace Cartridge Per Year	Total to Replace All Cartridges	Maintenance Cost (Table 4)	Total Maintenance Cost Per year
103	$215	$22,145	$10,300	$32,445

Table 5 summarizes the total cost to the Highway Department for maintaining the catch basins and catch basin inserts. These costs do not include the maintenance of the Cultec systems and are based off a conservative maintenance schedule of four inspections per year. When summing the $10,300 for the maintenance of the catch basins and the $22,145 to replace all of the cartridges annually, the total maintenance cost per year would be approximately $32,445 if the option to install catch basin inserts in all of the catch basins were chosen.

11. Summary

The outfalls located in the areas of the West Monponsett and East Monponsett Ponds are currently discharging nutrients, such as phosphorus, into both of the ponds. With the installation of the designed stormwater systems, the Town of Halifax could be capable of removing approximately 88% of the phosphorus loading from stormwater runoff. By reducing the phosphorus loading entering the East and West Monponsett Ponds, the Town of Halifax would have the capability of improving both of the ponds and meeting their TMDL requirements.

1. Project Management

1.1 Project Organization

Caitlyn Whittle, US EPA Region 1 Project Officer—Ms. Whittle will provide general oversite of the project and final review/approval of all final work deliverables.

Heather Radcliffe, NEIWPCC—Ms. Radcliffe will provide general oversite of the project and final review/approval of all final work deliverables.

Tom Borden, NBEP—Mr. Borden will provide general oversite of the project.

Cathy Drinan, Town of Halifax Board of Health—Ms. Drinan's primary role for this assignment will be the Town's main representative and manager. She will coordinate meetings, assist the consultant with the collection of past information, and ultimately use the results of this project to advocate for future grants for implementation of stormwater systems.

Town of Halifax Highway Department—Robert Badore, Highway Surveyor. The Town's Highway Department will provide field assistance in the form of opening/closing existing structures for mapping purposes, traffic control, and provide additional personnel to aid in the field verification of outfalls as needed.

Russell Kleekamp, GHD Project Manager—Mr. Kleekamp will be responsible for overseeing the gathering and evaluation of available secondary data and development of project deliverables. He will coordinate the needed engineers and field staff to locate, map, and prioritize outfalls to ensure maximum possibility of future grant funding for implementation.

Marc Drainville, GHD Project Director/QA-QC—Mr. Drainville is responsible for providing quality assurance/quality control for project deliverables.

Jessica Janney, Project Engineer—Ms. Janney is responsible for maintaining the official, approved QA Project Plan and ensuring the project meets its requirements.

Lines of communication for the project are summarized in the organizational chart shown in Figure 1.

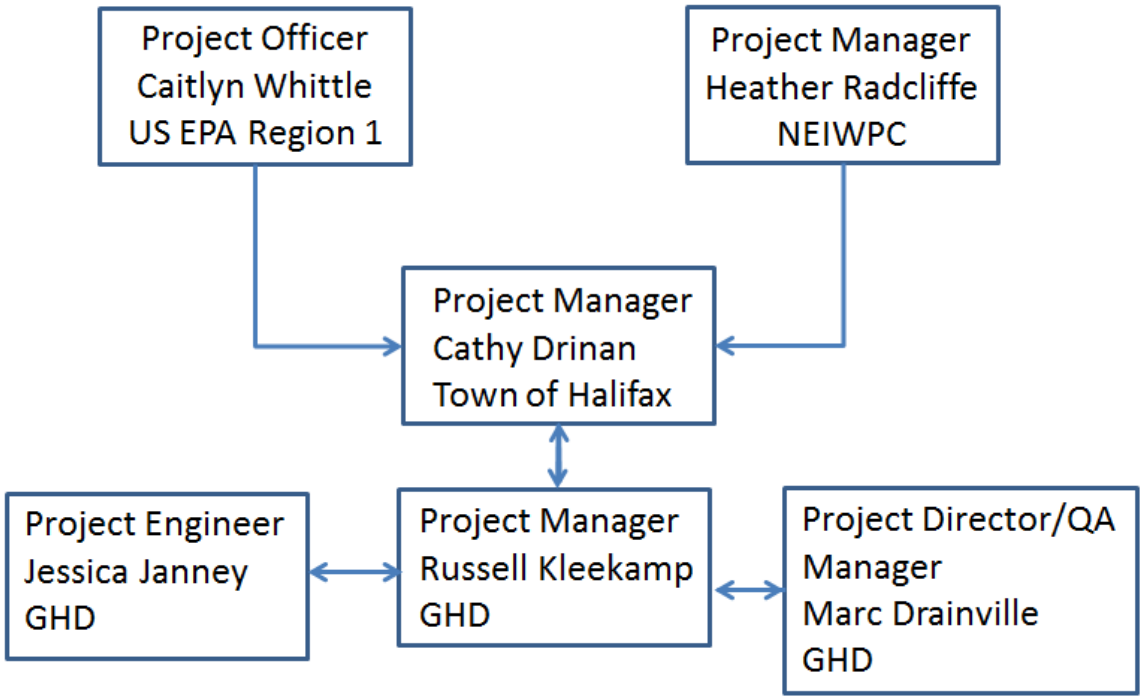

Figure 1 Project Organization Chart

1.2 Purpose of Study, Background Information, and Problem Definition

The purpose of study, background information, and problem definition is outlined in the Scope of Work for this project, which is attached as Appendix A.

1.3 Overview of Project Tasks

The objective of this project is to identify, map and prioritize the stormwater outfalls, scuppers and other point sources discharging to the East and West Monponsett Ponds. The extent of the project area is shown in Figure 2.

Figure 2 – Project Locus

Project tasks, including a summary of work to be performed, work schedule, details of geographical locations to be studied and resources, is outlined in the Scope of Work for this project, which is attached as Appendix A.

The following tasks in the Scope of Work require primary and secondary data collection:

- Review of available secondary water quality data from respected federal, state, and local agencies.
- Field verification of unknown outfalls and point discharges. GHD will travel the roads and developed areas around the ponds to locate catch basins and determine if they have a point discharge, such as an outfall pipe. GHD will also travel the bank of the ponds by boat to investigate any outfalls that may not be visible or accessible by land.
- A detailed topographic survey with wetland delineation will be developed for the three highest priority outfalls.

1.4 Quality Objectives and Criteria

1.4.1 Objective

The quality objective of this project is to accurately identify all stormwater outfalls and negative pollution influences in East and West Monponsett Ponds. The project will use both primary and secondary data sources.

The project will generate primary data through field investigation of outfalls, geolocation of the outfall locations, topographic surveys and wetland delineation. Accuracy, precision, bias, representativeness, completeness, comparability, and method sensitivity will be assessed collaboratively by GHD staff, based on the criteria and methodologies outlined in this document.

This project will also rely on existing (secondary) water quality data from respected and trusted federal, state, and local agencies—such as the Halifax Board of Health, Massachusetts Department of Environmental Protection (MassDEP), the Massachusetts Department of Public Health (DPH), and the Massachusetts Office of Geographic Information (MassGIS). The sources of all secondary data used in this project will be identified in all reports and deliverables and commentary on data quality will be included, if appropriate. Criteria

The following criteria will be used to ensure primary data meets the quality objectives for this project:

- Verify that all equipment used for the the collection of GPS coordinates for this project receives all necessary software and App updates prior to data collection, ensuring the most accurate readings and data possible.
- Ensure that GPS instruments utilized for data collection have an accuracy of +/- one cm on both the horizontal and state plan coordinate system.
- All GPS units shall be calibrated in accordance with the manufacturer's recommendations.
- The GPS user manual will be reviewed thoroughly to reduce potential bias or precision errors.
- Multiple readings shall be taken at each location to ensure precision of results.
- GPS output shall be compatible with the Commonwealth's GIS information mapping system.
- Coordinates should be collected in decimal degrees with as many decimal places as are available
- GPS data collected in the field will be compared to geo-rectified images from Google Earth to ensure precision in data collection.
- The professional judgement of GHD project staff will be relied upon evaluating results. Poor quality data will be rejected and replaced as part of this project.
- In the event that the GPS coordinates appear inaccurate or incomplete, the site will be re-visited and the coordinates shall be re-taken.

- All vertical survey and delineation data shall be based on North American Vertical Datum of 1988 (NAVD 88) and the horizontal control shall be based on NAD 1983 State Plan Massachusetts Mainland Projectional in feet.
- All survey work shall meet the Procedural and Technical Standards for the Practice of Land Surveying (250 CMR 6.00).

The following criteria will be used to ensure secondary data meets the quality objectives for this project:

- Verify that the data has been generated by a reliable source. Reliable sources for this project include data generated by federal, state, and local agencies, research institutions, and data that has been published in peer-reviewed articles or publications.
- Data has been generated through a program with a QAPP or similar plan documenting quality assurance and quality control procedures to ensure data accuracy, precision, representativeness, and comparability.
- All data used in this project shall be fully referenced.
- In order to ensure transparency in decision-making if any data is excluded from the study, the criteria and reasons to exclude the data will be documented in the deliverables for this project.
- A copy of every secondary data set shall be saved as a read-only, protected file that can be referenced during the development of the working dataset.
- All formulas including units, conversion factors, and formulas will be shown on the working dataset spreadsheet.

All of the data used for this project will be evaluated and ranked for data quality based on the data source. The data ranking order that will be used is: (1) collected under a QAPP, (2) published in a peer-reviewed scientific journal, (3) published in a technical report, (4) from an unpublished database.

The completeness of the dataset will be assessed through either an inspection of the metadata or the dataset itself. If completeness is deemed adequate, the Decision Data Tree, outlined in Figure 3, will be used to determine whether the data meets the quality objectives for this project.

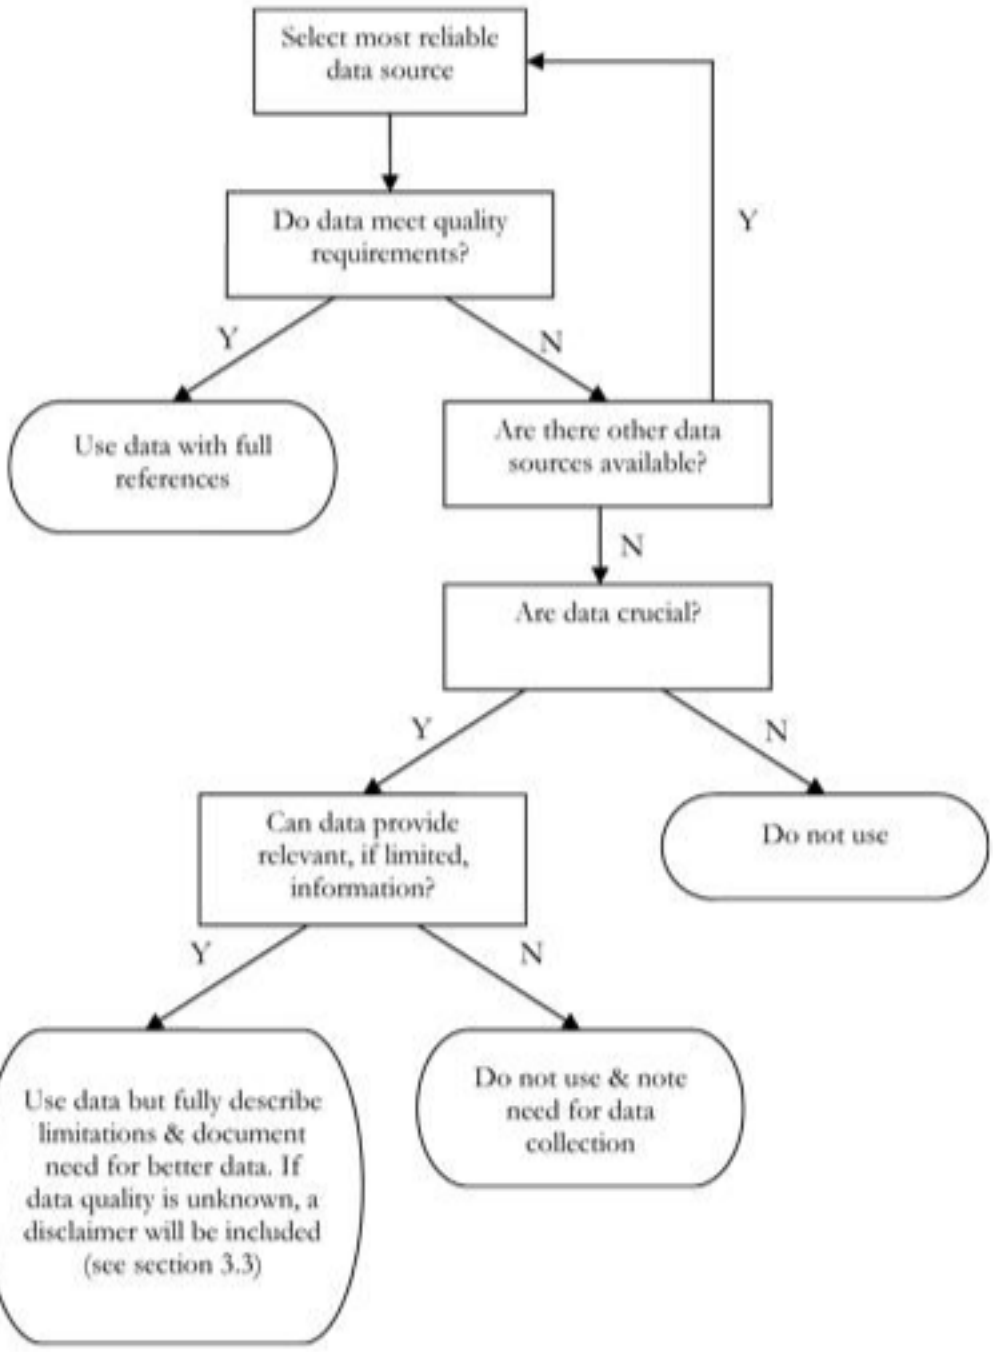

Figure 3 Decision Data Tree

1.5 Documentation and Records

All of the data collected for this project will be stored on the GHD computer network. GPS data gathered at each site will be stored in an Arc GIS v 10.2 compatible shapefile. All survey data will be stored as a .DWG file in a format compatible with Civil 3D 2012 or greater. All field-measured

data will be scanned and saved to the project files on the GHD computer network. Upon completion of the project, copies of all data files and metadata will be delivered to the Town of Halifax. All hard copy and electronic project documents and records will be retained by GHD for a minimum of ten years.

2. Data Selection and Management

2.1 Secondary (Existing Data)

2.1.1 Sources of Existing Data

This project will rely on existing data from trusted and respected federal, state, and local agencies, such as the Halifax Board of Health, MassDEP, Massachusetts Department of Health, and the Massachusetts Office of Geographic Information (MassGIS).

2.1.2 Intended Use of Existing Data

The goal of the Stormwater Outfall Assessment for East and West Monponsett Ponds Project is to accurately identify all stormwater outfalls and negative pollution influents on the ponds.

The Halifax Highway Department, with the assistance of the Old Colony Planning District, has completed catch basin mapping for the major roads and highly developed areas of Town, however the Highway Department has confirmed that there are numerous outfalls existing on the ponds that have not been identified or mapped to date. During this project outfalls and point sources will be located and recorded via GPS to an accuracy of +/- 1 cm on both the horizontal and state plan coordinate system compatible with the Commonwealth's GIS information mapping system.

Existing sampling data will be used to help identify negative pollution influences on the ponds and to assist in prioritizing untreated stormwater outfalls, scuppers, and other point discharge sources contributing stormwater pollution to East and West Monponsett Ponds.

2.1.3 Limitations on the Use of Existing Data

All data used for this project must meet the following requirements:

- Data was generated by a reliable source. Data sources that are generally trusted and respected include, but are not limited to, the Halifax Board of Health, Massachusetts Department of Environmental Protection (MassDEP), the Massachusetts Department of Health, and the Massachusetts Office of Geographic Information (MassGIS).
- Data was generated through a program with a QAPP, or similar plan documenting quality assurance and quality control procedures to ensure data accuracy, precision, representativeness, and comparability.
- All existing data sets used in the project must be generated using the same or comparable sampling and analytical methods or SOPs.
- Data must indicate if results are from composite or grab sampling.

The GHD project engineer is responsible for reviewing all acquired data and determining its acceptability for use in the project. Any identified limitations on the use of existing data will be discussed and documented in the final deliverables of this project.

2.2 Primary Data

Primary data that will be collected for this project is described in this section.

A. Geolocation of Outfall Coordinates, Obtained by Portable GPS

Field research will be conducted to locate any unknown outfalls, scuppers and other stormwater inputs to the pond throughout the developed areas around the ponds. Once land reconnaissance is completed, the consultants will travel the banks of the ponds by boat to investigate any outfalls that may not be visible or accessible by land. Once a landfall is located – either by land or water – the location will be recorded via GPS to an accuracy of +/- 1 cm on both the horizontal and state plan coordinate system compatible with the Commonwealth's GIS information mapping system.

B. Topographic Surveys and Wetland Delineation

A detailed topographic survey with wetland delineation will be developed for the three highest priority outfalls, as determined through the use of a prioritization matrix. All survey work shall meet the Procedural and Technical Standards for the Practice of Land Surveying (250 CMR 6.00).Sampling Methods and Custody

Geolocation of outfall coordinates will be obtained with a handheld GPS unit. All data obtained from the field investigation shall be recorded by hand in a field notebook, which shall be scanned and saved to the project server in a timely manner.

The topographic survey and wetland delineation shall be conducted in accordance with the Procedural and Technical Standards for the Practice of Land Surveying (250 CMR 6.00). All survey data shall be store in a .DWG file in a format compatible with Civil 3D 2012 or greater. Vertical and horizontal controls shall be listed in the general notes for the survey and all benchmarks shall be clearly indicated on the plans

2.2.1 Quality Control

All primary data collected in the field will be compared to geo-rectified images from Google Earth as a Quality Control measure. In the event that the GPS coordinates or topographical survey results appear inaccurate or incomplete, the site will be re-visited and the coordinate shall be re-taken.

Drainage calculations will be performed by or under the direction of a Registered Professional Engineer with HydroCAD Stormwater Modeling System (based on TR-55 and SCS unit hydrograph runoff procedure). All calculations will comply with MassDEPs "Stormwater Management Standards" requirements for treatment, peak rate attenuation and recharge. Design of stormwater control systems will follow MassDEPs "Documenting Compliance" guide and use a Type III 24-hour design storm.

2.2.2 Instrument/Equipment Testing, Inspection and Maintenance

All GPS units shall be calibrated in accordance with the manufacturer's recommendations prior to every field visit. All survey equipment shall be calibrated and maintained in accordance with the guidelines outlined in the Procedural and Technical Standards for the Practice of Land Surveying (250 CMR 6.00).

2.2.3 Data Management

All GPS coordinates obtained in the field will be recorded by hand in a field notebook. The relevant pages from the field notebook shall be stored in PDF format, as scanned copies, on the project server for record keeping.

All survey data shall be stored on the project server in a .DWG file in a format compatible with Civil 3D 2012 or greater.

All data for the project will be stored on the GHD project server for the duration of the project. The data will be provided in an electronic format to the Town of Halifax at the completion of the project. The GHD project engineer is responsible for monitoring compliance with the Data Management Plan.

3. Assessments and Oversite

3.1 Personnel Responsibility

The Stormwater Outfall Assessment for East and West Monponsett Ponds is being led by the Town of Halifax. GHD is responsible for the development of the Quality Assurance Project Plan (QAPP) and execution of the project. All personnel involved with this project are required to have reviewed and be familiar with this QAPP. No special training requirements or certifications are needed by project staff for the completion of the tasks outlined in the work plan. GIS analysis will be performed or overseen by qualified staff with proper GIS training and experience.

The GHD project engineer will be responsible for overall validation and final approval of the data in accordance with project purpose and use of the data. The GHD project director will provide a Quality Assurance/Quality Control (QA/QC) review of all project deliverables.

NEIWPCC may implement, at its discretion, various audits or reviews of this project to assess conformance and compliance with the quality assurance project plan in accordance with the NEIWPCC Quality Management Plan.

3.2 Documentation of Project Oversight and Problem Resolution

The GHD project engineer will review the data quality of all compiled data sets to determine if it meets the requirements of this QAPP. The GHD project director will provide a QA/QC review of all deliverables.

The findings of this review and any limitations of the data for this project will be discussed with the Town of Halifax and will also be documented in the final deliverables of this project. If inconsistencies are found in the quality of the base data, an effort will be made to identify and obtain more accurate base data.

4. Data Review – Verification, Validation, and Evaluation

The professional judgement of GHD's project staff will be relied upon in evaluating the data results for this project relative to the acceptance criteria outlined in Section 1.4.2. Poor quality data will be rejected and replaced as part of this assessment, if GHD staff determines it is inadequate. All rejected data sets will be documented in the deliverables of this project, along with the reasons for its rejection.

The following questions will be evaluated in order to determine if the data is adequate to be used in this project:

Is data unbiased and sufficiently representative?

Were data sets collected using the same or comparable methods or SOPs?

Were data sets collected by trained personnel familiar with the appropriate SOPs?

Do the data sets meet necessary detection limits and is it reported in the correct units of measurement?

Does primary data correlate closely with Google Earth geo-rectified images?

Was primary data collection equipment calibrated in accordance with the methods outlined in this QAPP?

5. Project Schedule

The project schedule is outlined in Table 1.

Table 1 Project Schedule

Scope Item	Deliverable
1. QAPP	June 2016
2. Review of Existing Information and Project Kickoff Meeting	July 2016
3. Field Verification of Outfalls and Point Sources	July - August 2016 (weather permitting)
4. Point Source (Outfall) Mapping	September 2016
5. Delineation of Drainage Areas and Stormwater Calculations	October 2016
6. Prioritization Matrix	February 2017
7. Conceptual Design	November 2016
8. Preliminary Designs (three outfalls)	December 2016
9. Cost Estimates	January 2017
10. Final / Quarterly Reports	Quarterly Reports submitted in: • August 2016 • November 2016 • February 2017 • May 2017 Draft Final Report • March 2017 Final Report • April 2017
11. Public Outreach and Education	May 2017
12. Project End Date	June 1, 2017

6. Project Reporting

Quarterly reports will be developed during the project describing work progress to date; completed outputs; problems encountered and anticipated; a statement of activity anticipated during the next reporting period; and a comparison of the percentage of the Project completed to the project schedule. If data sets are found to be not acceptable during the data review period, these findings will be noted in the quarterly report.

A final report will be developed summarizing project findings and recommendations. The report will also include recommendations of follow-up grant funding and approaches for project implementation. The report will include a quality assurance section and will identify all sources of existing data that were used in the report. The report will note that all data used in the project is available upon request.

This report: has been prepared by GHD for the Town of Halifax and *may only be used and relied on by the Town of Halifax for the purpose agreed between GHD and the Town of Halifax as set out in the Scope of Work for this project.*

GHD otherwise disclaims responsibility to any person other than the Town of Halifax arising in connection with this report. GHD also excludes implied warranties and conditions, to the extent legally permissible.

The services undertaken by GHD in connection with preparing this report were limited to those specifically detailed in the report and are subject to the scope limitations set out in the report.

The opinions, conclusions and any recommendations in this report are based on conditions encountered and information reviewed at the date of preparation of the report. GHD has no responsibility or obligation to update this report to account for events or changes occurring subsequent to the date that the report was prepared.

The opinions, conclusions and any recommendations in this report are based on assumptions made by GHD described in this report. GHD disclaims liability arising from any of the assumptions being incorrect.

QAPP – Stormwater Outfall Assessment for East and West Monponsett Ponds, Halifax MA

Project Abstract

The objective of this project is to identify, map, and prioritize the stormwater outfalls, scuppers, and other point sources discharging to the East and West Monponsett Ponds. The three highest ranked priority outfalls will have preliminary designs developed for them. There are estimated to be 20 outfalls. Emphasis for designs will be placed on the use of Best Management Practices (BMPs) and low impact development as recommended by previous EPA modelling completed for the contributing watershed.

Methodology used to map the outfalls will be to field locate from both land and water. Several outfalls are visible and are known by Town staff, but additional outfalls, scuppers, and point sources are expected to exist based on existing drainage infrastructure within the watershed. Once located, upstream drainage structures will be opened and investigated to delineate the contributing drainage area. Using aerial photography, GIS information, and LiDAR information, the contributing impervious area will be developed. Other criteria will be considered as described in the grant application.

The output is a prioritization and preliminary design for three outfalls discharging to the ponds. This will be valuable information that the Town will need for future grant funded efforts to implement BMPs within the watershed.

Application Narrative
Stormwater Outfall Assessment for the East and West Monponsett Ponds
Southeastern New England Program Water Quality Management Grants
Water Quality Management Grants for the Greater Narragansett Bay Watershed

I. INTRODUCTION AND PROBLEM DESCRIPTION. The Town of Halifax Board of Health and the Monponsett Watershed Association is pleased to submit the following application to assess the stormwater outfalls discharging untreated runoff to the Monponsett Ponds as a project under the Southeastern New England Program Water Quality Management Grant program.

Proposed work under this project would include:

- *Development of project QAPP.*
- *Review of existing information of known outfalls and point discharges.*
- *Field verification of unknown outfalls and point discharges.*
- *Outfall and point source discharge mapping.*
- *Drainage area delineation and related calculations.*
- *Develop prioritization schedule of outfalls.*
- *Conceptual designs for applicable sites.*
- *Preliminary (permit level) designs for three highest priority sites.*
- *Develop cost estimates of probable engineering and construction costs for all identified outfall and point source sites.*
- *Final memorandum of findings and recommendations for implementation.*
- *Public education and participation (three workshops total).*

As a community, we are greatly concerned with the untreated runoff; non-sustainable management practices of the ponds and the resulting decline in water quality; habitat; and overall health of the system. Dense development and the creation of impervious areas around the ponds have created a source for stormwater pollution entering the ponds, further degrading the already impaired habitat.

Within the Taunton River Watershed, lie the Monponsett Ponds. Split into a "west" and "east" basin by Route 58, the ponds play a unique role in these three watersheds due to a long history of manmade manipulations and interventions. The ponds are relatively shallow (approximately 13 feet at the deepest) water bodies that serve several public interests including drinking water supply, fisheries and wildlife habitat (including habitat for three state-listed species) flood control, and recreation.

In brief (to be expanded on later), the primary indicators of degradation in the ponds are:

- *Algal blooms (with results as high as 1,900,000 cells/ml (note threshold is 70,000 cells/ml per MDPH and trigger beach closures). West Monponsett Pond has been closed since July 9th 2015 to date from high algal blooms.*
- *Numerous untreated stormwater outfalls discharging untreated runoff to the ponds.*
- *Stagnation and idle flow due to diversions and artificial reversal of flow direction from west to east (exacerbating eutrophication).*
- *Elevated water levels and flooding concerns.*

- *Low dissolved oxygen.*
- *Fish kills.*
- *Excess and nuisance vegetation.*

To address the above problems, the Town of Halifax was previously awarded approximately $80,000 from the Massachusetts Department of Environmental Protection (MassDEP) through the Sustainable Water Management Initiative (SWMI) to further investigate the state of the ponds. The resulting report[1] analyzed the water budget and environmental impacts and concluded that the current management regime is non-sustainable.

The main challenge that this project will address is identifying and prioritizing the existing stormwater outfalls that contribute stormwater pollution to the ponds. To date, minimal efforts to improve the state of the runoff entering the ponds has been performed. While catch basin mapping and annual maintenance has been performed for the majority of the system, limited budgets have focused monies on higher priority projects within the Town. This project, if funded, will put into place an approach to systematically identify and mitigate outfalls that contribute the largest amounts of stormwater pollution into the ponds. The west basin has been identified as a Category 5 waterbody on the 2012 Massachusetts List of Integrated Waters for excess algal growth and phosphorus. Fish kills are also common to the ponds as excessive nutrients and vegetation limit dissolved oxygen resulting in the kills.

Previous water quality testing by the Halifax Board of Health, MassDEP and the Mass Department of Health all show excessive readings of algae on a routine basis and sometimes coliform in outfall plumes after a heavy rain. These are all exacerbated by the runoff that enters the pond, carrying elevated amounts of nutrients and harmful bacteria.

The approach of identifying outfalls, prioritizing, and mitigating has worked successfully for other municipalities in the region. The Towns of Brewster, Provincetown, and Wareham have all used grant funds to identify multiple outfalls contributing pollution to a single water body, and followed up with implementation actions to mitigate the harmful effects.

From 2014 to the present, three additional significant efforts have also been initiated to study the water quality of the ponds.

1. Priority Project Recognition by the Massachusetts Division of Ecologic Restoration, where flow restoration efforts have been developed for Stump Brook which drains to West Monponsett Pond.

2. MassDEP awarded a second SWMI grant for the study of automated controls on Stump Brook Dam.

3. USEPA implemented their Watershed Management Optimization Support Tool (WMOST) for the Monponsett Watershed. This tool identified critical areas within the watershed that would benefit from the installation of Low Impact Development (LID) and green stormwater infrastructure to reduce the pollutant loading to the ponds. This will be a key criterion for the development and prioritization of outfalls to the ponds.

---

[1] *Sustainable Water Management Initiative Report, Monponsett Pond and Silver Lake Water Use Operations and Improvement*, SWMI Project No. BRP 2012-06, Princeton Hydro, LLC Ringoes, NJ, July 2013.

II. OBJECTIVES. The primary objective for this project is to identify and prioritize untreated stormwater outfalls, scuppers, and other point discharge sources contributing stormwater pollution to the Monponsett Ponds. This will serve as a basis for future grant funding to allocate funding for the final design and construction of mitigating controls at the existing outfalls. This project will be consistent with the following attributes as listed in the RFP:

The applicant demonstrates sufficient organizational ability to administer and carry out a project. The Town of Halifax has recently been awarded numerous grants for various projects including funding from US EPA, MassDEP, and MassDER. The Town has posted past project and grant results on their webpage.

The effort addresses water quality or habitat impaired by nutrients or pathogens, particularly those identified on the Integrated List of Impaired Waters or as otherwise described in this RFP, and is consistent with the Program's goal of improving water quality, habitat degradation, or human health risks caused by nutrients or pathogens, whether in a single impaired watershed, or across multiple impaired watersheds. The very purpose of this application is to develop an approach and prioritization to address nutrient and pollution loading from stormwater inputs that have been a documented source of impairment to the Monponsett Ponds (West Monponsett Pond is a Category 5 Impaired water body with numerous inpairments). The degraded state of waters has interfered with the welfare of abutting residents through health concerns and impacted recreational measures. The State recently installed a new boat ramp on West Monponsett that remains closed the majority of the year due to algal blooms. West Monponsett Pond currently has the longest consecutive closure due to algal blooms in the Commonwealth. This closure has extended well over 100 days in length. The degraded state of the water also has the potential to impact Silver Lake, a primary drinking water source, through its' hydraulic connection (4-foot diameter aqueduct) with the Monponsett Ponds.

The project shows potential for regional transferability. The approach used for this project has been successful in numerous communities within southeastern Massachusetts and Cape Cod, including Brewster, Orleans, Provincetown, and Wareham. To date, these communities have received over 4 million dollars of subsequent grant funds for implementation of stormwater treatment systems. The implementation of this assignment for the Town of Halifax will be a continued effort showcasing the worth of this assessment for other communities to follow.

The project has watershed-level benefits or an implementation plan that increases the scale of project benefits or cost effectiveness. As stated before, the implementation plan will be based on the prioritization of outfalls identified within this assessment. By leveraging future grant funding for construction, the result will maximize the financial return for the Town of Halifax.

The project invests strategically to leverage resources and harness innovative, cost effective solutions with the potential for high-impact results. Technologies considered for outfall rehabilitation will yield the highest pollutant removal rate given the conditions of the outfall site. Advances in LID and other green infrastructure have yielded astonishing results for other communities. As an example, porous asphalt was placed on Commercial Street in Provincetown as a stormwater treatment measure. Where there was once numerous beach closures after rain events, the Town has an almost 100% reduction in closures since this technology was implemented. This will be one of the many technologies reviewed for implementation as part of this project.

A municipality or municipalities will be the lead or a key partner. The Town of Halifax Board of Health will be the lead partner with support from the Town's Highway Department.

III. METHODOLOGY. The scope of work for this project will be as follows:

Task 1. Quality Assurance Project Plan (QAPP). Develop a QAPP in accordance with NEIWPCC and EPA standards. Project QAPP will be in accordance with the R-5 Checklist provided by NEIWPCC quality management website. The project QAPP will cover data collection, generation, compilation, analysis, evaluation, and/or use of environmental data as needed for this project. Delieverables will include draft and final QAPPs.

Task 2. Project Research / Project Kick-Off Meeting. The first task of the project will be for the project consultant to meet with the Town of Halifax Highway Department and Board of Health to review the project. Items discussed will include known sampling locations for bacteria and algae, the sampling results, any existing catch basin mapping of the streets or contributing area surrounding the ponds, and other relevant information. The Halifax Highway Department, with the assistance of the Old Colony Planning District has completed catch basin mapping for the major roads and highly developed areas of the Town, but the Highway Department has confirmed that numerous outfalls exist on the ponds that have not been identified or mapped to date. The goal of this task is to accurately inform the project stakeholders of the project and collect the work completed to date. Deliverables include meeting minutes and copies of relevant data collected at the meeting.

Task 3. Field Verification of Outfalls and Point Sources. This task will include the field research and investigation to locate any unknown outfalls, scuppers, and other stormwater inputs to the ponds. Developed areas around the ponds will be investigated to determine the location of drainage systems through visual observation. The consultants will travel the roads and developed areas around the ponds to locate catch basins and determine if they have a point discharge such as an outfall pipe. Other sources of stormwater influence such as scuppers, swales, and other stormwater conveyances leading to the pond will also be mapped. Once the land reconnaissance is completed, the consultants will travel the bank of the ponds by boat to investigate any outfalls that may not be visible or accessible by land. Over time, aged drainage systems become "lost" either from private property encroachments or overgrown brush and are commonly not found due to such occurrences. Travel by boat around the perimeter of the pond will give a secondary check on known outfalls and may yield other unknown outfalls. Once an outfall is located—either by land or water—the location will be recorded via GPS to an accuracy of +/- 1 cm on both the horizontal and state plane coordinate system compatible with the Commonwealth's GIS information mapping system. The target goal of this task is to accurately identify all stormwater outfalls and negative pollution influences on the ponds. Deliverables include GPS locations and mapping of all located outfalls.

Task 4. Point Source (Outfall) Mapping. Once the outfalls and other inputs around the pond have been identified, this task will develop the mapping of each drainage system connected to the outfalls. Each outfall will have a series of catch basins, pipes, and related infrastructure that collect flow from the receiving drainage area. The drainage infrastructure will also be mapped and displayed for each of the outfalls located. This will be a critical step to determine the size of the drainage areas leading to each outfall so that accurate stormwater calculations can be developed. The goal of this task is to map the coverage of all drainage areas leading to the outfalls located during Task 2. Deliverables include mapping of all located drainage piping, catch basins, and infrastructure.

Task 5. Delineation of Drainage Areas and Stormwater Calculation. Once mapping is complete, each drainage area will be delineated and separate calculations will be developed totaling the impervious (roads, rooftops, etc.) and pervious areas. These areas will be used to develop storage volumes for the 0.5-, 1.00-, and 1.25-inch rain events for each outfall. Additionally, peak runoff from the 2-, 5-, 10-, and 25-year storm events will also be developed. To develop the impervious and pervious areas, the consultants will use aerial photography to identify roads, rooftops, and other impervious features. These areas will then be totaled within a drainage area to develop the total impervious surface for each outfall located. The calculations will be used to develop sizing for conceptual designs of the drainage areas leading to each outfall. The goal of this task will be to develop final stormwater volumes and calculations needed for the conceptual stormwater designs. Deliverables include drainage calculations.

Task 6. Prioritization Matrix. Using developed criteria, a prioritization matrix will be developed for each outfall's implementation. The criteria used to develop a priority outfall include:

- *Impervious area within the drainage area*
- *Cost of implementation*
- *Availability of public or useable land for construction*
- *Required operation and maintenance of the recommended system*
- *Past sampling results indicating frequent spikes of coliform and/or algal blooms*
- *Any treatment that is already in place and needs to be rehabilitated*

These criteria are general and may be tailored to better fit the needs of the Town of Halifax. Once created, this list will identify the priority outfalls that the Town should address to mitigate the highest degree of stormwater pollution entering the ponds on a timely basis. Deliverables include the prioritization matrix.

Task 7. Conceptual Designs. Once stormwater calculations are complete, we will develop conceptual designs for each of the outfalls. Designs will be based using subsurface leaching where the water table allows, and surface treatment for other areas. LID techniques will also be considered as needed for outfalls if traditional infiltration or surface treatments are not an option. The goal of this task is to develop conceptual plans that can be used to assist with the prioritization of outfalls leading to the ponds.

Task 8. Preliminary Designs. This task will take the conceptual designs of the three highest priority outfalls and bring them to the preliminary (or permit) level of detail. Detailed topographic survey will be included along with wetland delineation; invert and elevation information for the selected technology; and project specifications. These designs will be ready for submission to the required regulatory agency (Halifax Conservation Commission) upon future grant funding.

Task 9. Cost Estimates. Based on the conceptual designs, a cost estimate will be developed to determine the necessary funding and planning for each outfall. Cost estimates will be separated by line item for each outfall located. Deliverables include cost estimates for each outfall.

Task 10. Final / Quarterly Reporting. Using the information gathered in Tasks 1 through 9, a final report will be developed summarizing project findings and recommendations. This report will also include recommendations of follow-up grant funding and approaches for project implementation. The report will contain all of the information gathered in Tasks 1 through 8. We will also develop quarterly

reports as required by NEIWPCC. Deliverables include the draft reports for comment and final reports to the Town and the NEIWPCC.

Task 11. Public Education and Presentations. The Town and their consultant will host a series of three workshops for the general public, Monponsett Working Group, and the Monponsett Watershed Association. The health agent will write articles for the local newspapers on the topic and the progress of the project.

IV. EXPECTED OUTPUTS AND OUTCOMES. The following deliverables will be generated for each Scope of Work item:

SCOPE ITEM	DELIVERABLE
1. QAPP	Draft and Final QAPP
2. Review of Existing Information and Project Kick Off-Meeting	Meeting Minutes
3. Field Verification of Outfalls and Point Sources	Field Notes / Observations
4. Point Source (Outfall) Mapping	Outfall Mapping, both hard copy and electronic
5. Delineation of Drainage Areas and Stormwater Calculations	Copy of Stormwater Calculations
6. Prioritization Matrix	Priority Ranking of Outfalls / Point Sources to Rehabilitate
7. Conceptual Designs	Conceptual Designs for all Outfalls
8. Preliminary Designs (three outfalls)	Preliminary Design for Three Outfalls
9. Cost Estimates	Copies of Cost Estimates
10. Final / Quarterly Reports	Draft and Final Reports for Review
11. Public Outreach and Education	Copies of Presentations

V. EVALUATION METHODS. The success of this project will be based on the future implementation of the developed BMPs. The intent of this project is to develop a prioritization of outfalls and preliminary designs of multiple areas, so that future water quality grants may be utilized for construction and implementation. Since the Monponsett Ponds also serve as tributaries to a surface water supply, numerous grants could be sought for construction dollars, which include following years of this program, the 319 Grant Program, MassDEPs SWMI program, CZM opportunities, as well as other grant sources. The ultimate method of evaluation will be after outfall rehabilitation and improvements to the water quality are measured, based on ongoing Town and Mass DPH sampling.

VI. ROLES AND RESPONSIBILITIES. The follow parties will be responsible for this project:

Town of Halifax Board of Health – Cathy Drinan, Health Agent. The Board of Health has been the Town's spokesperson and manager for almost all related efforts for the Monponsett Ponds. Ms. Cathleen Drinan has detailed project knowledge of the extensive work to date with the ponds, sampling records, environmental knowledge of soils surrounding the pond, and an excellent relationship with the community. Her primary role will be the Town's main representative and manager for this assignment. She will coordinate meetings, assist the consultant with the collection of past information, and advocate for future grants for implementation of stormwater systems.

Monponsett Watershed Association (MWA). The Mission Statement of the MWA is "To educate the public and to restore and preserve the Monponsett Ponds consisting of the West Monponsett Pond and the East Monponsett Pond hereinafter referred to as Monponsett Ponds for clean water and safe recreational use." They will provide meeting forums where presentations on the importance of stormwater control and what individual landowner's can do to help improve the water quality of the ponds.

Town of Halifax Highway Department – Robert Badore, Highway Surveyor. The Town's Highway Department will provide field assistance in the form of opening/closing existing structures for mapping purposes, traffic control, and provide additional personnel to aid in the field verification of outfalls as needed.

GHD Inc. The Town's engineering consultant, GHD Inc., will develop the project deliverables as previously mentioned. They are a local firm based out of Hyannis, Massachusetts, that has extensive stormwater management experience and have previously worked with the Town of Halifax securing past grant opportunities. They will provide the needed engineers and field staff to locate, map, and prioritize outfalls to ensure maximum possibility of future grant funding of implementation. Detailed resumes of personnel can be provided upon request.

VII. TIMELINE. Our anticipated project schedule would be 12 months (or sooner) from the Notice to Proceed based on the following task breakdown. We would expect this to be completed well before the date of June 30, 2017.

SCOPE ITEM	DELIVERABLE
1. QAPP	Month 1
2. Review of Existing Information and Project Kick Off-Meeting	Month 2
3. Field Verification of Outfalls and Point Sources	Months 2-3 (weather permitting)
4. Point Source (Outfall) Mapping	Month 4
5. Delineation of Drainage Areas and Stormwater Calculations	Month 5
6. Prioritization Matrix	Month 9
7. Conceptual Designs	Month 6
8. Preliminary Designs (three outfalls)	Month 7
9. Cost Estimates	Month 8
10. Final / Quarterly Reports	Month 10-11 Final, Months 3, 6, 9, 12 for Quarterly
11. Public Outreach and Education	Month 12

VII. OTHER. This project is in accordance with the following plans and reports at a local, state, and federal level (all plans and reports available upon request) including:

1. *Habitat Management Plan for Phosphorus Inactivation in the Western Basin of Monponsett Pond*, developed by Lycott Environmental, May 2012.

2. *SUSTAINABLE WATER MANAGEMENT INITIATIVE REPORT Monponsett Pond and Silver Lake Water Use Operations and Improvement SWMI Project No. BRP 2012-06*, developed by Princeton Hydro, July 2013.

3. *Taunton River Watershed Climate Change Adaptation Plan*, prepared by the Manomet Center for Conservation Sciences, May 2013.

4. *Taunton River Watershed Management Plan Phase I - Data and Assessment Final Report*, prepared by the Horsley Witten Group, December 2008.

5. *Taunton River Stewardship Plan*, prepared by the Taunton Wild & Scenic River Study Committee, Southeast Regional Planning & Economic Development District and the National Park Service, July 2005.

PROJECT BUDGET		
BUDGET CATEGORY *(Add/remove itemizing lines below major categories as necessary, but do NOT delete major categories)*	***MATCH***	***GRANT REQUEST***
A. PERSONNEL (list individual names and titles below) **TOTAL:**	**$19,050**	**$54,135**
Cathy Drinan, Halifax Health Agent ($30/hr and 166.4 hrs)	*$4,992*	$
Robert Badore, Halifax Highway Surveyor ($32/hr and 24 hrs)	*$768*	$
Highway Laborer ($22/hr and 72 hrs)	*$1,584*	$
Monponsett Watershed Volunteers ($8/hr and 39 hrs)	*$312*	$
Marc Drainville, PE, (GHD) Project Director ($195.73/hr and 38.5 hrs)	$	$7536
Russell Kleekamp, (GHD) Project Manager ($181.41/hr and 72 hrs)	$5,000	$8,062
Jessica Janney, (GHD) Project Engineer ($114.58/hr and 143 hrs)	$6,456	$9,929
James O' Brien, (GHD) Senior GIS Specialist ($118.80/hr and 236 hrs)	$	$27,977
B. FRINGE BENEFITS _____**% of** _____ (e.g., 10% of total personnel costs) **TOTAL:**	**$**	**$**
C. TRAVEL (estimate number/purpose of trips below) **TOTAL:**	**$**	**$850**
Expenses – Mileage from Hyannis to Halifax – approx. 1540 total miles	$	$850
D. EQUIPMENT (itemize below) **TOTAL:**	**$**	**$**
E. SUPPLIES (itemize below) **TOTAL:**	**$**	**$2,985**
Consumables – Reports, Maps, Prints, etc.	$	$2,985
F. CONTRACTS (identify & itemize below) **TOTAL:**	**$**	**$**
G. OTHER (identify & itemize below) **TOTAL:**	**$**	**$**
H. TOTAL DIRECT COSTS (SUM OF A-G)	**$19,112**	**$57,338**
I. INDIRECT COSTS _____**% of** _____ (e.g., 10% of total direct costs) **TOTAL:**	$	$
J. TOTAL PROJECT COST (SUM OF H+I)	**$19,112**	**$57,338**

APPENDIX C: TASK-BASED BUDGET FORMAT

Cost (Without Match)	Task #	Task Name	Expected Date of Completion
$3,263	1	QAPP	Month 1
$653	2	Project Research / Project Kick-Off Meeting	Month 2
$8,782	3	Field Verification of Outfalls and Point Sources	Months 2-3 (weather pending)
$5,417	4	Point Source (Outfall) Mapping	Month 4
$11,444	5	Delineation of Drainage Areas and Stormwater Calculations	Month 5
$7,146	6	Conceptual Designs (all outfalls)	Month 6
$9,658	7	Preliminary Designs (3 total)	Month 7
$2,276	8	Cost Estimates	Month 8
$134	9	Prioritization Matrix	Month 9
$3,788	10	Final / Quarterly Reports	Month 10-11
$4,778	11	Public Education and Presentations	Month 12
$57,338			

The total project cost for this assignment is $76,450. This is further broken down into a man-hour matrix in the Attached Table 1. The match amount provided in this application is $19,112. This is made up of the following sources:

- $5,000 cash contribution from the Massachusetts Division of Ecologic Restoration.
- $6,456 cash contribution from the Halifax Highway Department through Chapter 90 funds.
- $7,656 through in-kind labor provided by the Town of Halifax staff and Monponsett Watershed Association volunteers.

The remaining balance of $57,338 is being requested through this grant. This amount, plus the contributions from Halifax Highway and DER will total $68,794, which will fund the Town's consultants (GHD) to perform the above tasks 1 through 11 and develop project deliverables.

TABLE 1
Proposed Budget for
Town of Halifax, Massachusetts
Stormwater Outfall Assessment for the East and West Monponsett Ponds
February 8, 2016

Task	Project Director Marc Drainville PE, BCEE	Project Manager Russell Kleekamp	Project Engineer Jessica P. Kick-Off Meeting Minutes

Minutes

21 September 2016

Project	Stormwater Outfall Assessment for the East and West Monponsett Ponds	From	Craig Curtin
Subject	Kick-Off Meeting	Tel	774-470-1653
Venue/Date/Time	Halifax Highway Department, 9/21/16, 8:30 a.m.	Job No	11110997
Copies to	All Attendees and Non-Attendees		
Attendees	Cathy Drinan—Town of Halifax, BOH Robert Badore—Town of Halifax, Highway Surveyor Kim Roy—Town of Halifax, Board of Selectmen Russ Kleekamp—GHD Craig Curtin—GHD	Non-Attendees	Robert Brown—Town of Halifax

A. CONTACTS

1. Chief Ted Broderick – Halifax Police Chief – chief@police.halifax.ma.us
2. Melissa Traynor – Highway Administrative Assistant – mtraynor@town.halifax.ma.us
3. Bob Badore – Halifax Highway Surveyor – rbadore@town.halifax.ma.us
4. Stephen Gillett – Plymouth County Mosquito Control Project – (781) 585-5450

B. INTRODUCTIONS

1. Mr. Kleekamp and Mr. Curtin were introduced to Ms. Drinan, Ms. Roy and Mr. Badore. Mr. Kleekamp was introduced as the Project Manager and Mr. Curtin as the engineer who will be conducting the field work for the project.

C. REVIEW OF PROJECT SCOPE

1. Mr. Kleekamp stated that the project will include reviewing known information and locations of the current stormwater structures that are located in the watershed of the Monponsett Ponds.
2. Review of Catch Basin Mapping
    a. Mr. Kleekamp described that the catch basins would be all opened, inspected, and documented. The mapping will allow GHD to provide the Town of Halifax with a file that will contain the locations of the catch basins, outfalls, and culverts within the watershed of the Monponsett Ponds.
    b. Mr. Curtin will make sure the confirmed outfalls are accounted for and will confirm the locations of the unconfirmed outfalls.

GHD Inc. 1545 Iyannough Road Hyannis MA 02601 USA
T 1 774 470 1630 **F** 1 774 470 1631 **E** hyamail@ghd.com **W** www.ghd.com

3. Discussion on Known/Unknown Outfalls

    a. Ms. Drinan was able to provide the following outfall locations that are in addition to what was found on the provided map:

        i. On the south-eastern side of the East Monponsett Pond there is a pipe most likely connected to an irrigation pond, on the farm off of Plymouth Street.

        ii. On a Mr. Greggory's property, there is a possible second outfall near the outfall shown on the map. May need to conduct a dye test to see which outfall the catch basins are discharging towards. Mr. Curtin to follow up with Ms. Drinan to schedule a time to visit Mr. Greggory's property.

        iii. On the south-eastern side of East Monponsett Pond there is a pipe for the aqueduct that carries the water from the pond to Silver Lake.

    b. Ms. Drinan provided the top three locations that have been problematic for the Town of Halifax:

        i. Halifax Beach Association where there is an outfall. This is on private property.

        ii. 4th Avenue, there is a dirt road which is used as a boat ramp. This location experiences visible erosion and has an area where water gathers. This is on public land.

            - The water appears to travel through some old stone trench and into this area. The area could be a good option for a gravel wetland.

        iii. Between 17 and 19 Lake Street there are visible catch basins and outfall in this location.

4. Procedures for Field Verification of Catch Basins and Outfalls

    a. Safety Concerns

        i. Steel-toed boots are recommended when removing the catch basins.

        ii. Police detail may be useful when working on Route 58 as there are sharp turns and it is a busy road.

    b. Opening of Structures

        i. Mr. Curtin will coordinate with Mr. Badore on working with a highway department employee for transportation between catch basins and to help with opening the catch basins. Mr. Badore stated that they work from 7:00 a.m. to 3:00 p.m.

    c. Data Collection

        i. While in the field Mr. Curtin will collect data on the catch basins, including the catch basin's size, number of inverts, direction of inverts, condition of structure, and any other notable information regarding the catch basins.

        ii. Weather permitting, Mr. Curtin will perform dry-weather monitoring at the outfalls to see if there is any flow at the outfalls during a time when there has been no rainfall for 24 hours. If there is flow

observed at the outfall, an investigation will have to be conducted to see if there is any illicit discharges into the stormwater piping system.

iii. Mr. Curtin should contact Ms. Traynor, the Highway Department's administrative assistant, two days in advance of planned work so that Mr. Badore can schedule an employee to help with the field work.

d. Police Details

i. Mr. Curtin will contact Ms. Drinan when field work will be conducted along Route 58 so it can be determined if a police officer will be able to direct traffic while the field work is conducted in the road.

ii. Field work along Route 58 will be planned to be conducted last.

e. Incorporation into GIS

i. GHD will coordinate with the Old Colony Planning Council to see if they have any additional information on the stormwater systems.

5. Outfall Mapping

a. The final map will show the locations of the stormwater structures and will include the size, number of inverts, direction of inverts, condition of structure, and a picture of each structure.

6. Delineation of Drainage Area and Calculations

a. Mr. Curtin will work with Mr. O'Brien, the designer in GHD's office, to find the drainage areas for the outfalls discharging to the Monponsett Ponds. Mr. Curtin will verify these drainage areas in the field.

7. Prioritization

a. Mr. Kleekamp described how the stormwater structures will be prioritized in order to decide on the best options for treatment systems. The systems will be prioritized by their: contribution area, sampling results, public safety concerns, history of complaints, cost, and the land available in those areas. Mr. Kleekamp stated that it is easiest to implement treatment systems on public land, instead of applying for easements of private land.

b. Ms. Drinan stated that the outfalls that discharge into West Monponsett Pond should be prioritized because that is the pond that experiences the most problems.

8. Conceptual Designs

a. Mr. Kleekamp discussed that three conceptual designs will be produced. The designs will show the proposed work to be done, the cost estimates, available funding through grants, and the designed nutrient removal.

b. Mr. Kleekamp stated that surface treatment is better than leaching systems as the surface treatment is better at removing nitrogen and phosphorus, which are the leading problems in the Monponsett Ponds.

D. NEW BUSINESS

1. Mr. Curtin to contact a representative from the Plymouth County Mosquito Control Project and see if they have any information on the stormwater systems.
2. Field work will most likely begin during the first week in October. Mr. Curtin will be in contact with the Highway Department to coordinate when he will be in Halifax.
3. Mr. Curtin will contact Ms. Drinan so she can provide assistance with locating the structures that are not on the map produced by the Old Colony Planning Council.

Attachment C
Outfalls in Project Area

*N/A - Conceptual Design not created since drainage area does not discharge to or towards pond
**Precipitation Data From the National Weather Service Forecast Office

Outfall	Location Description	Found?	Discharges to Pond?	Discharge on Town Land?	Outfall Pipe Size		Cost Estimates*			Total Area		
					Inner Diameter (in.)	Outer Diameter (in.)	Catch Basin Insert Only	Insert and Deep-Sump	Per Designs	(ft^2)	acre	(mi^2)

Attachment D
Dry-Weather Outfall Inspection Forms

OE 1

Outfall ID: [redacted] **Town:** Halifax

Inspector: C. Curtin **Date:** 10-17-16

Street Name: Monponsett Street

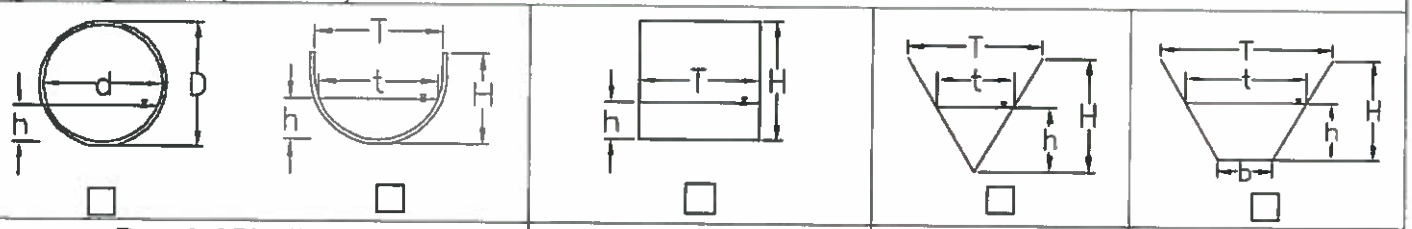

Last Rainfall Event: 10/10/16 2.00 in.

Receiving Water: East Lake

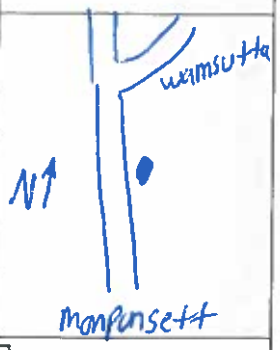

DRY WEATHER OUTFALL INSPECTION FORM

Type of Outfall (check one):		**Pipe Outfall** ☐	**Open Swale Outfall** ☐
Pipe Material:	Concrete ☐ Corrugated metal ☐ Clay Tile ☐ Plastic ☐ Other: _____ ☐	**Swale Material:**	Paved (asphalt) ☐ Concrete ☐ Earthen ☐ Stone ☐ Other: _____ ☐
Pipe Condition:	Good ☐ Poor ☐ Fair ☐ Crumbling ☐	**Swale Condition:**	Good ☐ Poor ☐ Fair ☐ Crumbling ☐

Shape of Pipe/Swale (check one)

Rounded Pipe/Swale ☐ ☐	Rectangular Pipe/Swale ☐	Triangular Swale ☐	Trapezoidal Swale ☐

Pipe Measurements:	**Swale Measurements:**	**Is there a headwall?**	**Location Sketch**
Inner Dia. (in): d= _____	Swale Width (in): T= _____	Yes ☐ No ☐	
Outer Dia. (in): D= _____	Flow Width (in): t = _____	**Condition:**	
Pipe Width (in): T= _____	Swale Height (in): H= _____	Good ☐ Poor ☐ Fair ☐ Crumbling ☐	
Pipe Height (in): H= _____	Flow Height (in): h= _____		
Flow Width (in): h= _____	Bottom Width (in): b= _____		

Description of Flow: Heavy ☐ Moderate ☐ Trickling ☐ Dry ☐

If the outlet is submerged indicate approximate height of water above the outlet invert. h above invert (in):

Odor:	Yes ☐	No ☐
Optical enhancers suspected?	Yes ☐	No ☐
Has channelization occurred?	Yes ☐	No ☐
Has scouring occurred below the outlet?	Yes ☐	No ☐

Required Maintenance:

Tree Work	Remove Trash/Debris
Ditch Work	Blocked Pipe
Structural Corrosion	Erosion at Structure
N/A	Other

Circle All Materials Present:

Rip rap	Sheen: Bacterial
Excessive sediment	Sheen: Petroleum
Foam	Floatables
Sanitary Waste	Algae
Orange Staining	Excessive Vegetation

Comments: Could not access - fence and vegetation

ADAPTED FROM THE CENTRAL MASSACHUSETTS REGIONAL STORMWATER COALITION

Outfall ID: OE2 **Town:** Halifax

Inspector: C. Curtin **Date:** 10-17-16

Street Name: Wamsutta Avenue

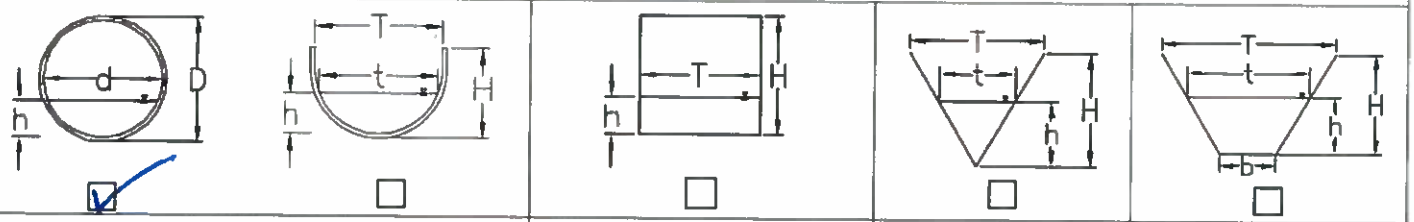

Last Rainfall Event: 10/10/16 2.00 in.

Receiving Water: East Lake

Inner Dia. (in): d= _____	Swale Width (in): T= _____	Yes ☐ No ☐	
Outer Dia. (in): D= _____	Flow Width (in): t = _____	**Condition:**	
Pipe Width (in): T= _____	Swale Height (in): H= _____	Good ☐ Poor ☐ Fair ☐ Crumbling ☐	
Pipe Height (in): H= _____	Flow Height (in): h= _____		
Flow Width (in): h= _____	Bottom Width (in): b= _____		

Description of Flow: Heavy ☐ Moderate ☐ Trickling ☐ Dry ☐

If the outlet is submerged indicate approximate height of water above the outlet invert. h above invert (in):

Odor:	Yes ☐	No ☐
Optical enhancers suspected?	Yes ☐	No ☐
Has channelization occurred?	Yes ☐	No ☐
Has scouring occurred below the outlet?	Yes ☐	No ☐

Required Maintenance:

Tree Work	Remove Trash/Debris
Ditch Work	Blocked Pipe
Structural Corrosion	Erosion at Structure
N/A	Other

Circle All Materials Present:

Rip rap	Sheen: Bacterial
Excessive sediment	Sheen: Petroleum
Foam	Floatables
Sanitary Waste	Algae
Orange Staining	Excessive Vegetation

Comments: Can't find pipe, lots of grass dumping could be covering it up

ADAPTED FROM THE CENTRAL MASSACHUSETTS REGIONAL STORMWATER COALITION

Engineers Estimate of Probable Construction Costs
Halifax Stormwater Assessment
Conceptual Designs
GHD Job #11110997

Item	Cost
12" HDPE Pipe	$ 65 Per Linear Foot
Asphalt	$ 35 Per Square Yard
Cultec Infiltration	$ 1,000 Per Cultec Unit
Surface Treatment	$ 200 Per SY
Catch Basin Insert	$ 965 Per Unit
Settling Tank	$ 7,500 Per Unit
Leaching Pits	$ 4,000 Per Unit
Drain Manhole	$ 5,000 Per Unit
Deep-Sump Catch Basin	$ 5,000 Per Unit

CONCEPTUAL DESIGNS CONSTRUCTION COSTS	$1,936,000

Item #	Description	Quantity	Units	Unit Cost	Item Cost	Group Subtotal	Rounded to Nearest $5,000
1	**OW-01 and OE-18**					**$93,240**	**$95,000**
1.1	Deep-Sump Catch Basin	2	EA	$ 5,000	$ 10,000		
1.2	Drain Manhole	1	EA	$ 5,000	$ 5,000

CONSTRUCTION NOTES

1. BASE PLANIMETRIC SURVEY INFORMATION PROVIDED BY GREEN SEAL ENVIRONMENTAL, INC SAGAMORE BEACH , MA DATED 2/15/2017 IN NAVD88 DATUM.

2. LIMIT OF WORK SHALL BE WITHIN THE PUBLIC RIGHT OF WAY. NO WORK SHALL BE CONDUCTED ON PRIVATE PROPERTY UNLESS OTHERWISE NOTED.

3. CONTRACTOR SHALL RETURN ALL AREAS TO ORIGINAL CONDITION OR BETTER INCLUDING, BUT NOT LIMITED TO, ROADWAYS, BITUMINOUS CONCRETE, LANDSCAPED AREAS AND CURBING, UNLESS OTHERWISE NOTED.

4. THE MASSACHUSETTS DEPARTMENT OF TRANSPORTATION STANDARD SPECIFICATIONS FOR HIGHWAYS AND BRIDGES ARE INCORPORATED INTO THESE PLANS BY REFERENCE. THE TERM "MASS HIGHWAY" OR "SPECIFICATION" SHALL MEAN THE MASSACHUSETTS DEPARTMENT OF TRANSPORTATION STANDARD SPECIFICATIONS FOR HIGHWAYS AND BRIDGES, DATED 1988. UNLESS OTHERWISE INDICATED, ALL MATERIALS AND METHODS SHALL BE IN CONFORMANCE WITH MASS HIGHWAY SPECIFICATIONS.

5. PROPOSED CONDITIONS SHOWN HEAVY. EXISTING CONDITIONS SHOWN LIGHT.

6. ALL CONCRETE STRUCTURES SHALL HAVE OFFSET SLAB TOP OR ECCENTRIC CONE TOP UNLESS OTHERWISE INDICATED ON PLANS.

7. ALL DRAINAGE PIPING SHALL BE 12" INSIDE DIAMETER CORRUGATED HDPE TYPE N-12 PIPE MANUFACTURED BY ADS OR EQUAL SUITABLE FOR H-20 LOADING AT MINIMUM BURIED DEPTH OF 24". PIPE SHALL BE SUPPLIED IN 20 FT LENGTHS. JOINTS SHALL BE SOIL TIGHT PUSH ON JOINTS.

8. CATCH BASINS SHALL BE PROVIDED WITH SINGLE GRATE INLET PER MASS HIGHWAY STANDARDS, UNLESS OTHERWISE NOTED.

9. FINAL LOCATION OF ALL DRAINAGE STRUCTURES TO BE COORDINATED WITH RESIDENT PROJECT REPRESENTATIVE PRIOR TO STARTING WORK.

10. PIPE SHALL BE SLOPED AT A MINIMUM OF 1.0% UNLESS OTHERWISE NOTED.

11. CONTRACTOR IS RESPONSIBLE FOR VERIFYING ALL UTILITIES PRIOR TO EXCAVATION, INCLUDING UTILITIES NOT MARKED BY DIG-SAFE (888-DIG-SAFE (344-7233)), NOT SHOWN ON THE SURVEY, OR NOT MARKED BY THE HALIFAX HIGHWAY DEPARTMENT. CONTRACTOR IS RESPONSIBLE FOR ANY AND ALL DAMAGES IF AN UNDERGROUND UTILITY IS DAMAGED DURING THE COURSE OF CONSTRUCTION.

12. IN THE EVENT THAT ANY UTILITY, UNDERGROUND OR OVERHEAD, IS DAMAGED DURING CONSTRUCTION, CONTRACTOR SHALL IMMEDIATELY NOTIFY ENGINEER, HALIFAX HIGHWAY DEPARTMENT, AND THE APPROPRIATE UTILITY COMPANY.

13. ALL PAVEMENT TO BE SAW-CUT.

14. ALL CONNECTIONS BETWEEN PRECAST CONCRETE SECTIONS SHALL BE SEALED WITH NON-SHRINK GROUT.

15. LEACHING PITS, SETTLING TANKS, FLOW CONTROL STRUCTURES AND INLETS SHALL BE CONSTRUCTED IN ACCORDANCE WITH THE MASSACHUSETTS HIGHWAY DEPARTMENT STANDARD SPECIFICATIONS FOR HIGHWAYS AND BRIDGES, UNLESS OTHERWISE NOTED.

16. ALL PRECAST CONCRETE STRUCTURES SHALL BE RATED FOR AASHTO/H-20 LOADING.

17. ALL MATERIALS USED AND CONSTRUCTION METHODS EMPLOYED ARE TO BE IN ACCORDANCE WITH THE LATEST FEDERAL, STATE AND TOWN REGULATIONS.

18. NOT ALL EXISTING ITEMS (INCLUDING TREES, PLANTERS, HEDGES, SIDEWALKS, FENCE, GUIDE LINES, ETC.) ARE SHOWN ON DRAWINGS. HOWEVER THE CONTRACTOR SHALL BE RESPONSIBLE FOR ANY DAMAGE TO EXISTING ITEMS, INCLUDING BUT NOT LIMITED TO LANDSCAPING, CURBING AND SIDEWALKS. ALL DAMAGED ITEMS SHALL BE RESTORED TO THEIR EXISTING CONDITION OR BETTER AND AT NO ADDITIONAL COST TO THE OWNER.

19. CONTRACTOR SHALL REMOVE AND REPLACE ANY TREES DAMAGED BY CONSTRUCTION OPERATIONS THAT ARE NOT DESIGNATED FOR CLEARING.

20. CONTRACTOR IS RESPONSIBLE FOR DETERMINING DEPTH OF GROUNDWATER AND FOR ALL COSTS ASSOCIATED WITH DEWATERING NECESSARY TO INSTALL STRUCTURES OR PIPING.

21. ANY UNSUITABLE MATERIAL ENCOUNTERED DURING EXCAVATION (ORGANICS, PEAT, ETC.) FOR DRAINAGE STRUCTURES SHALL BE DISPOSED OF BY THE CONTRACTOR AT THEIR EXPENSE. CONTRACTOR IS RESPONSIBLE FOR PROVIDING SUITABLE CLEAN BACKFILL PER THE CONTRACT DOCUMENTS FOR BACKFILL AND COMPACTION.

22. ALL MANHOLE COVERS, PULL BOXES, CATCH BASIN GRATES AND OTHER UTILITY COVERS SHALL BE RAISED AS NEEDED TO BE FLUSH WITH THE TEMPORARY PAVING IF APPLICABLE.

23. ALL TEMPORARY PAVING SHALL BE MAINTAINED ON AN AS-NEEDED BASIS BY THE CONTRACTOR PER THE REQUEST OF THE TOWN OF HALIFAX. ANY IMPERFECTIONS IN THE TEMPORARY PAVEMENT THAT ARE SUBSTANTIATED DURING THE CONTRACT TIMES SHALL BE RESTORED BY THE CONTRACTOR AT NO ADDITIONAL COST TO THE OWNER.

24. ALL FINAL PAVING SHALL BE GUARANTEED FOR A PERIOD OF ONE YEAR AFTER INSTALLATION. ANY DEFORMATIONS, CRACKS OR DEVIATIONS SHALL BE REPAIRED AT THE EXPENSE OF THE CONTRACTOR, SEE SPECIFICATIONS SECTION 02980.

25. ANY DISTURBED PAVEMENT MARKINGS OR STRIPING BY THE CONSTRUCTION ACTIVITIES SHALL BE REPLACED AT AN EQUAL OR BETTER CONDITION, INCLUDING COLOR, THICKNESS, WIDTH, TYPE AND LOCATION. SEE SPECIFICATION SECTION 02980.

26. COVERS IN ROAD MUST BE PLACED NEAR CENTER OF TRAVEL LANE AS POSSIBLE. OFFSET STRUCTURE COVERS MAY BE NECESSARY BASED ON LOCATION OF UTILITIES IN FIELD OR OTHER CONDITIONS.

BASIS OF DESIGN (FOR INFORMATION ONLY)

1. STORMWATER CONTROL SYSTEMS WERE DESIGNED TO PROVIDE INCREMENTAL IMPROVEMENT BY CAPTURING AND INFILTRATING RUNOFF FROM RAIN THAT FALLS ON THE IMPERVIOUS SURFACE (TOWN ROADS) TO THE MAXIMUM EXTENT PRACTICABLE.

EROSION & SEDIMENTATION CONTROL NOTES

1. ALL EROSION AND SEDIMENTATION CONTROL MEASURES SHALL BE INSPECTED BY THE CONTRACTOR DAILY AND IMMEDIATELY AFTER PERIODS OF RAINFALL. REPAIR AND/OR MAINTENANCE OF SEDIMENTATION AND EROSION CONTROL MEASURES SHALL BE MADE AS SOON AS NEEDED. THE CONTRACTOR IS RESPONSIBLE FOR THE IMPLEMENTATION AND MAINTENANCE OF ALL CONTROL MEASURES ON THIS SITE.

2. FINAL LOCATION OF ALL SEDIMENTATION CONTROL MEASURES SHALL BE COORDINATED WITH THE TOWN CONSERVATION OFFICE PRIOR TO CONSTRUCTION.

3. LAND DISTURBANCE SHALL BE KEPT TO A MINIMUM. RESTABILIZATION WILL BE SCHEDULED IMMEDIATELY AFTER ANY DISTURBANCE.

4. EROSION AND SEDIMENTATION CONTROL MEASURES SHALL BE INSTALLED PRIOR TO ALL CONSTRUCTION ACTIVITIES.

5. ANCHOR ALL TOPSOIL STOCK PILES WITH STRAW MULCH AND RING WITH SILT FENCE, OR HAYBALE BARRIER.

6. SEDIMENT REMOVAL FROM CONTROL STRUCTURES SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR. SEDIMENT SHALL BE DISPOSED OF IN A MANNER WHICH DOES NOT RESULT IN ADDITIONAL EROSION AND WHICH IS CONSISTENT WITH THE CONTRACT DOCUMENTS AND REGULATORY REQUIREMENTS.

7. THE EROSION AND SEDIMENTATION CONTROL MEASURES DESCRIBED HEREIN ARE INTENDED AS A GENERAL GUIDE FOR THE CONTRACTOR. IT IS THE CONTRACTOR'S RESPONSIBILITY TO PROVIDE ANY AND ALL WORK NECESSARY TO PREVENT EROSION OF SOIL FROM THE CONSTRUCTION SITE. TO PREVENT EROSION, THE CONTRACTOR SHALL PROVIDE SILT FENCES OR OTHER CONTROL MEASURES AS THE NEED ARISES DURING CONSTRUCTION AT NO ADDITIONAL COST TO THE OWNER.

8. PAVED ROADWAYS SHALL BE KEPT CLEAN AT ALL TIMES.

9. CATCH BASINS NOT SHOWN ON SURVEY WITHIN THE CONTRACTORS STAGING AREA MAY BE SUBJECT TO EROSION AND SEDIMENTATION CONTROL MEASURES IF SO DIRECTED BY THE ENGINEER.

LEGEND
FOR PROPOSED CONDITIONS

- 1+00 — CONSTRUCTION BASELINE AND STATION
- 62 — MAJOR CONTOUR INTERVAL

1 D01 TYPICAL PAVED SURFACE TREATMENT DETAIL

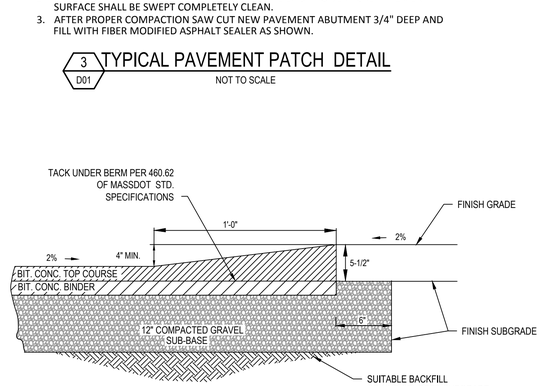

NOT TO SCALE

NOTES:
1. EXISTING BITUMINOUS PAVEMENT SHALL BE REMOVED TO A CLEAN STRAIGHT EDGE VIA SAW CUTTING. THE SAW CUT SHALL BE COMPLETED PERPENDICULAR TO THE ROADWAY/SIDEWALK.
2. PRIOR TO INSTALLING THE WEARING COURSE THE EXISTING VERTICAL PAVEMENT SURFACE SHALL BE SWEPT COMPLETELY CLEAN.
3. AFTER PROPER COMPACTION SAW CUT NEW PAVEMENT ABUTMENT 3/4" DEEP AND FILL WITH FIBER MODIFIED ASPHALT SEALER AS SHOWN.

1 D02 CATCH BASIN DETAIL

NOT TO SCALE

NOTES:
1. ALL CATCH BASINS SHALL BE 4' DIAMETER.
2. EXTERIOR SURFACES TO BE SEALED WITH COLD APPLIED BITUMINOUS SEALER.
3. REINFORCEMENT SHALL BE MIN. 0.12 SQ. IN. PER VERTICAL FOOT, PLACED IN ACCORDANCE WITH AASHTO DESIGNATION M-199.
4. FACE OF PIPE FLUSH OR NOT TO PROJECT MORE THAN 4-IN. FROM FACE OF WALL ALONG CENTERLINE OF PIPE.
5. ALL CATCH BASINS SHALL MEET THE REQUIREMENTS OF THE HALIFAX HIGHWAY DEPARTMENT.
6. ANY CATCH BASINS INSTALLED ADJACENT TO GRANITE CURBING MUST RECEIVE GRANITE THROAT STONES.

NOTES:

1. WEIGHT (EMPTY): 35 LB MAX, NO CARTRIDGE.

2. MATERIAL:
   A) ADJUSTABLE FLANGE AND DEFLECTOR: ALUMINUM ALLOY 6063-T6
   B) BASIN (PLASTIC): POLYPROPYLENE POLYETHYLENE COPOLYMER
   C) CORNER FILL: ALUMINUM ALLOY 5052-H32
   D) SUPPORT HARDWARE: CRES 300 SERIES OR EQUAL

3. PERFORMANCE CHARACTERISTICS (TYP):
   A) DEBRIS CAPACITY: 2.5 CU-FT
   B) FILTERED FLOW RATE (CLEAN, STANDARD CARTRIDGE): 115 GPM (0.25 CFS)
   C) PROTECTED BYPASS FLOW RATE: 900 GPM (2.0 CFS)

4. CLEAR OPENING RANGE (.5 INCREMENTS):
   A) MINIMUM SIZE: 19.0 X 22.0
   B) MAXIMUM SIZE: 24.0 X 27.0

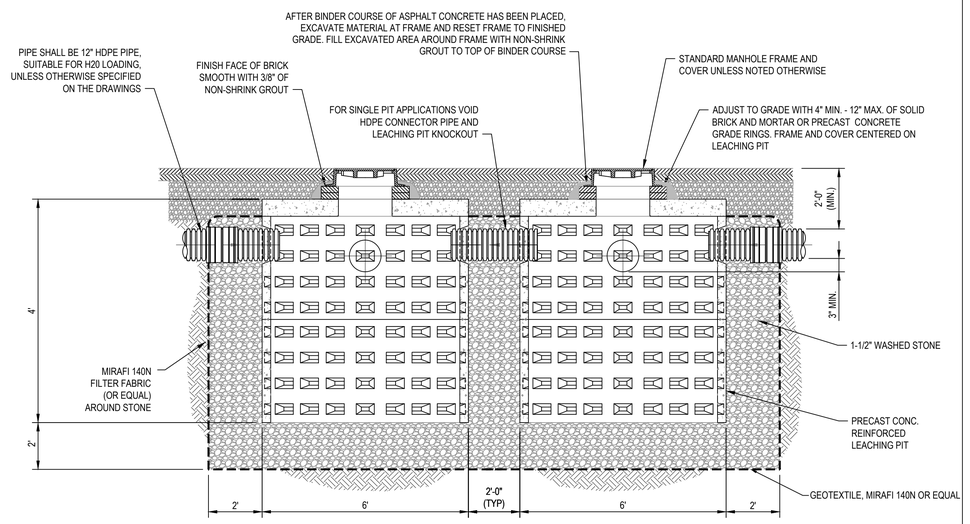

5. RECOMMENDED MINIMUM VAULT DEPTH: 2-IN BELOW CARTRIDGE

6. TYPICAL INSTALLATION: REMOVE STORM GRATE, MEASURE CATCH BASIN CLEAR OPENING AND ADJUST FLANGES TO REST ON GRATE SUPPORT LEDGE, INSTALL CORNER FILL PIECES, REINSTALL STORM GRATE DIRECTLY ON STORMBASIN SUPPORT FLANGES.

7. USE ONLY FABCO REPLACEABLE MEDIA CARTRIDGES.

2 D02 STORMBASIN BY FABCO

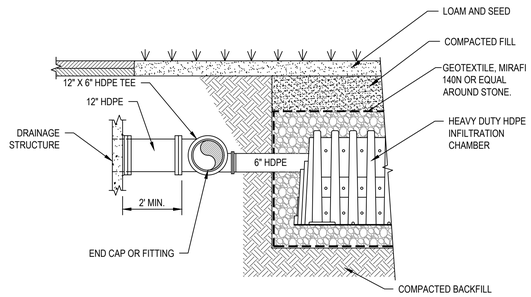

NOT TO SCALE

3 D02 STANDARD SINGLE OR MULTIPLE PRECAST CONCRETE LEACHING PIT

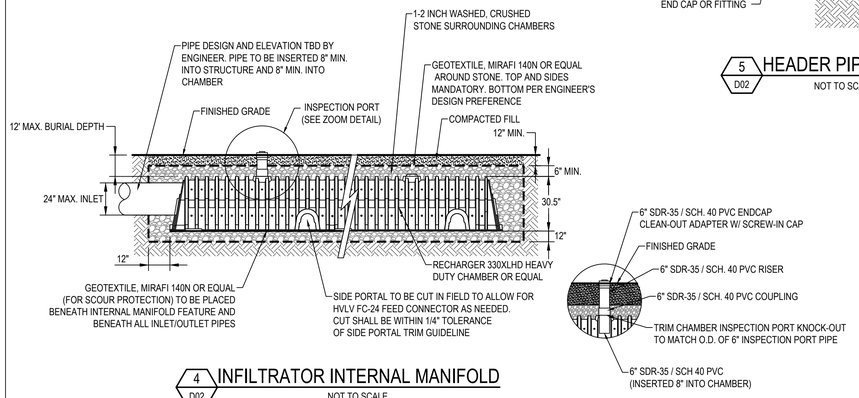

NOT TO SCALE

NOTES:
1. CONCRETE MINIMUM STRENGTH SHALL BE 4,000 PSI @ 28 DAYS.
2. STEEL REINFORCEMENT: AS-615, GRADE 60.
3. DESIGN LOADING: AASHO-HS-20.

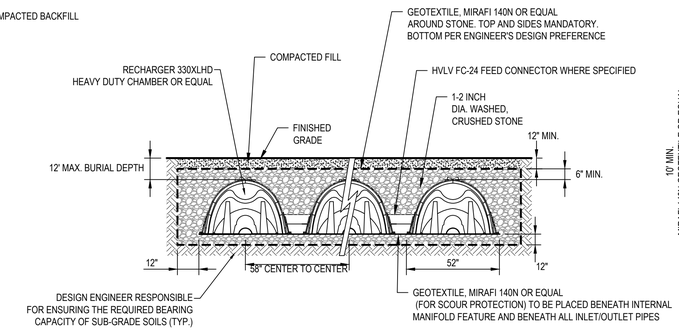

5 D02 HEADER PIPE DETAIL
